Background

- **Phenotype = Genes + Environment**
- Something missing?
- 120x microbial cells vs cow cells
- Densest population on earth
- Cow = Bioreactor

Less than 1% are culturable

- Next generation sequencing technologies
- Culture independent
- Microbiomics
 - cow + microbes = holobiont
- Metagenomics
 - genome + metagenome = hologenome

Holobiont theory of evolution

$$\bullet \quad P = G + E \quad \longrightarrow \quad P = G \times M \times E$$

- If G & M contribute to P
- One unit under natural selection

Zilber-Rosenberg and Rosenberg, 2008;
Bordenstein & Theis, 2015

- E.g Corals, insects and plants

Shapira, 2016

- No evidence in livestock species (yet)

Background

- Mutualism coevolved ~ 50 million years
 - Rumen microbes not found elsewhere or distinct
- Feed utilization **and methane**
 - Completely dependent on rumen microbes

Photo: Yokoyama & Cobos

Ignoring **M** = results in suboptimal response to **G** & **E**

Is a cow a holobiont?

G x M

- Rumen microbes in new born calves = **vertical transmission**, means unknown (Guzman et al 2015)
- Breeds differ (Paz et al 2016)
- Rumen transfaunation = **cow specificity** & **horizontal transmission** (Weimer et al 2010)
- Metagenomic prediction of **CH₄** dairy cattle (Ross et al, 2013)

Objectives

Broad: Can we tell if cows are holobionts?

$$Y = Xb + Za + Wm + e$$

Specific: 1) Is there a link between G x M?

2) Is there a link between M and CH₄?

3) Can we quantify this?

Rumen Samples

OTU	SampleA	SampleB	SampleC
OTU_1	0	12	8
OTU_2	1	22	0
OTU_3	6	0	2

- Rumen Flora Scoop
- 16S rRNA gene amplicon sequencing & assembly
- Alignment & assembly: 'bins' 97% similarity = OTU
- OTU ~ relative counts of different **bacterial** and **archaeal** species

Data

- 750 lactating Holsteins (6 herds) - **E**
- Phenotypes:
 - Methane Production(**CH₄**)
 - Energy Corrected Milk (**ECM**)
 - Body Weight (**BW**)
- Rumen Bacterial (4030) & Archaeal (203) OTU's
- Pedigree ~16000

Are rumen microbes heritable?

$$Y = Xb + Za + e$$

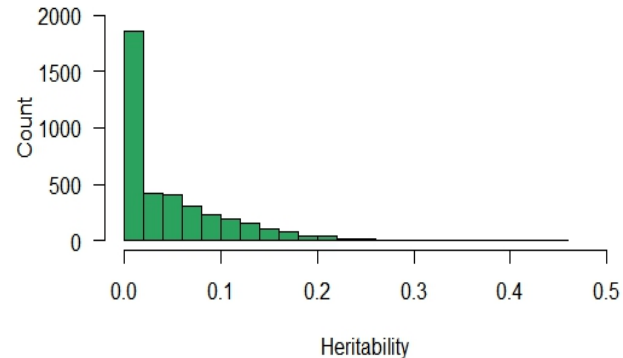

Results (1): heritability

- Archaea
 - 12% h^2
 - h^2 ranging from 0 – 0.35
- Bacteria
 - 6% h^2
 - h^2 ranging from 0 – 0.45

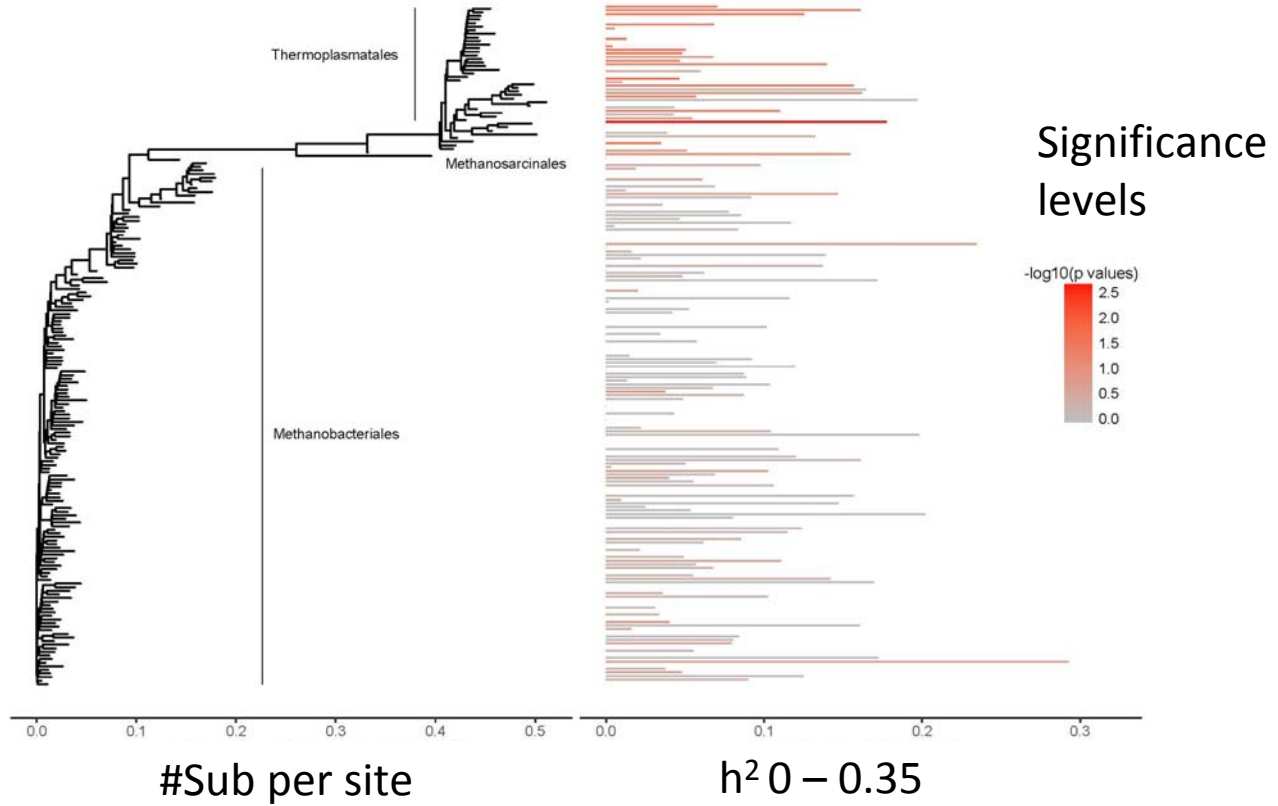

Distribution of heritability estimates for archaea

Distribution of heritability estimates for bacteria

Results (1) h^2 of microbes

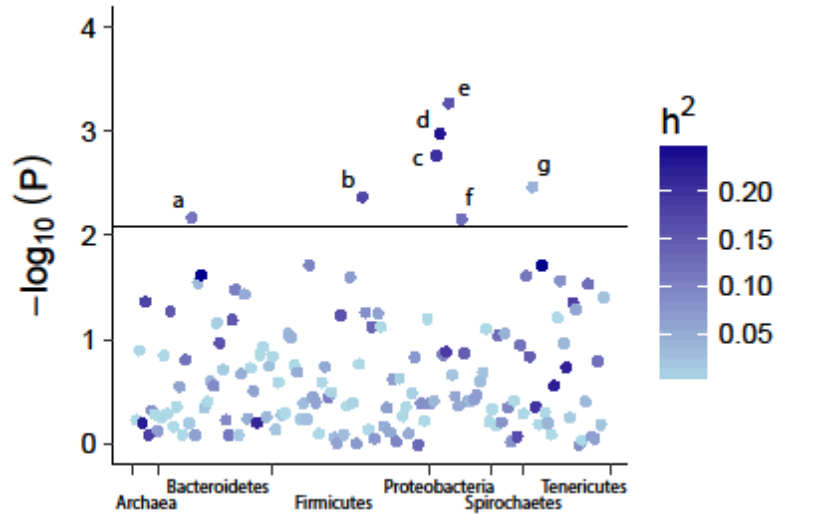

**Is the relative abundance of
rumen microbes associated with
CH₄?**

$$CH_4 = Xb + Za + e$$

Results (2) microbes and CH₄

- *MWAS*

- *Sporobacter*
- *Sphaerochaeta*
- *Unclassified BS11*
- *Unclassified Victivallaceae*

Is variation in the rumen microbiome explaining variation in CH₄ emission?

$$Y = Xb + Za + Wm + e$$

Analysis

- Variance components estimation DMU

$$Y = Xb + Za + Wm + e$$

- Microbial relationship matrix

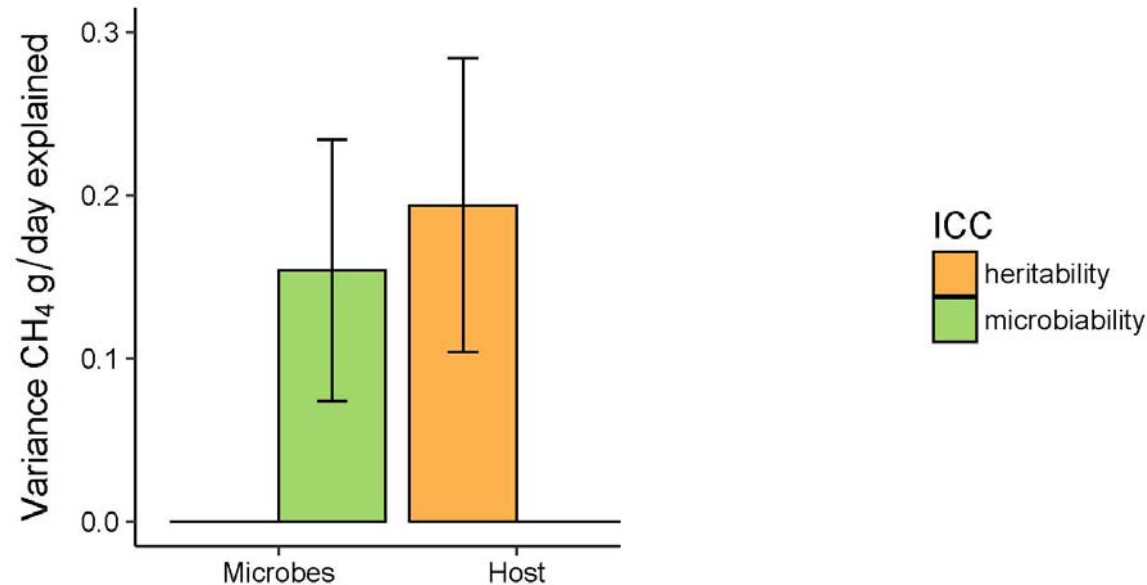

$$h^2 = \frac{Va}{Vp} \quad m^2 = \frac{Vm}{Vp}$$

16S rRNA bacterial **Microbiability** (m²)ance intra-class correlation coefficient

Results 3 - Microbiability

- $Y = Xb + Za + Wm + e$

*See Camarinha-Silva et al 2017 similar findings in pigs

Conclusions

- *Some* rumen microbes – h^2
- Associations between rumen microbes & CH₄
- Are our cows holobionts? – Yes!
- h^2 of CH₄ is (almost) independent of m^2
- m^2 - a tool for identifying and quantify M contributions to complex phenotypes (holobiont)

WCGALP – Application?

- Rumen transfaunation – probiotics?
- Possible indicator traits?
- Selection for holobiont (EBV + MV) over EBV?
- Many questions remain...

Thanks for your time

What are
you, a clown?
