DataGene in conjunction with the Monash University Teams Initiative developed a proof of concept solution for an automated cow-side data capture tool with the following capabilities:

- Voice recognition driven in a noisy, wet, and dirty environment
- Prepopulated artificial insemination information for technicians
- Voice recording of insemination information which could then be converted to text and uploaded to a cloud server
- Be capable of operation without an internet connection

It was identified that an App be developed for both Android and iOs devices which would incorporate all of these functions.

Currently the App is in Alpha phase, with a full Beta test App available sometime in the second quarter of 2018.
