Economic Affairs

# Background

**Huge amount of relevant (?) data** is generated related to dairy operations

**From a lot of different sources on farm and off farm** (farmer, veterinarians, claw trimmers, labs, breeding and performance recording organisations, dairy processing operations, technology providers, ...)

**Technological advances** (genomics, robotic and AI, omics technologies, information technologies, ...)

## Problem/challenges

- Separate viewing / analysis of data / little data integration (e.g. Rutten et al. 2013)
- no holistic perspective

Pictures: SCR by Allflex, smaXtec, Wasserbauer, mpr Bayern, illumina

**D**Dairy

# Holistic approach for prediction of disease

**P. Klimek** (Austrian Scientist of the year 2021: „ In Austria no other species has as much data as cattle“ )

**Farm- and management specific information**  
(location, feeding, housing, climate,...)

Picture: Biomin

Picture: Obritzhauser

**Animal specific information**

Mik yield / composition, milking speed, fertility, cyclus, mastitis, ...

Body Condition Score, Weight

Temperature

Feed intake, respiration, methane emissions

Activity, lying, standing

Claw, health, lameness, linear scoring,...

# Research questions

Digitalization holds potential to significantly improve the early detection and prevention of animal diseases

## Research questions:

- Do complex integrated datasets enable and improve early detection of animal diseases?
- Do advanced methodological approaches improve prediction performance?

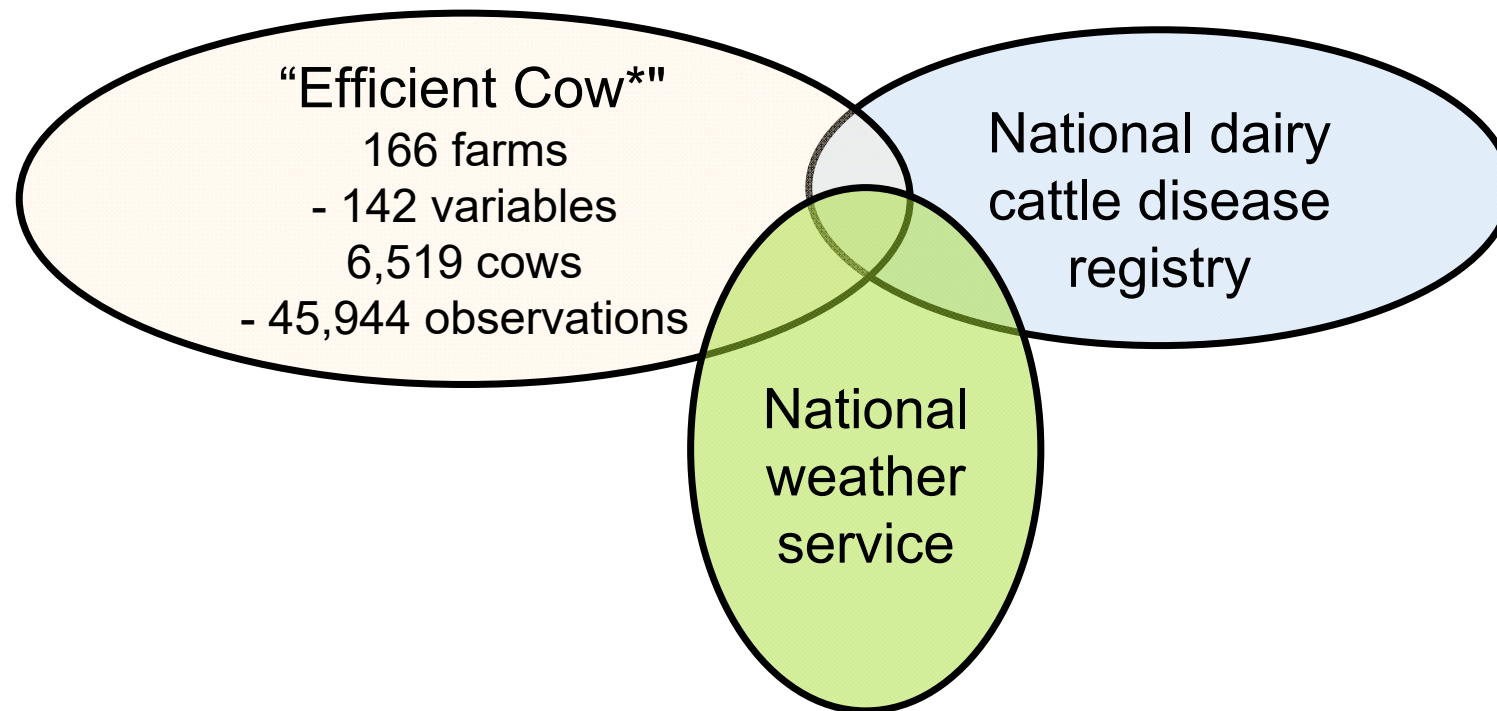

## Prerequisite:

1. Data quality & quantity:
  - Collecting, connecting data
2. Methodological approaches for the analysis of large data sets

**D**Dairy

# Individualized disease prediction by data integration

**Table 1.** Frequency of diagnoses for the eight most frequent diseases<sup>1</sup>

| Diagnosis                   | N observations | %    |
|-----------------------------|----------------|------|
| Lameness                    | 3,670          | 39.6 |
| Acute mastitis              | 1,037          | 11.2 |
| Anestrus                    | 803            | 8.7  |
| Ovarian cysts               | 705            | 7.6  |
| Periparturient hypocalcemia | 673            | 7.3  |
| Ketosis                     | 657            | 7.1  |
| Chronic mastitis            | 335            | 3.6  |
| Metritis                    | 318            | 3.4  |
| Other                       | 1,062          | 11.5 |

<sup>1</sup>The percentages denote the share of the diagnoses among all diagnoses in the diagnoses dataset.

Lasser et al. 2021

# Aggregation of data

**D**Dairy

Lasser et al. 2021

# Farm-Risk-Profile

## Cluster 1

lowest prevalence:

- Anestrus
- Ketosis
- Chronic Mastitis
- Metritis
- Ovarian Cysts

## Cluster 2

## Cluster 3

## Cluster 4

highest prevalence:

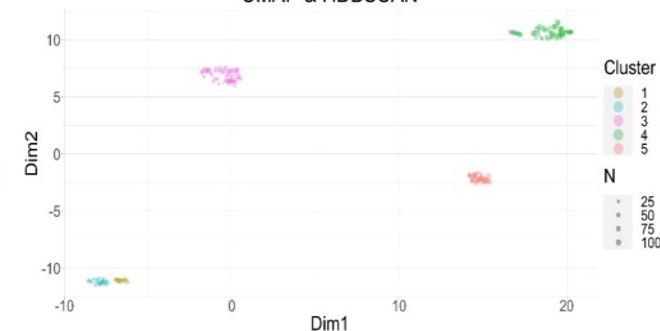

- Anestrus
- Acute Mastitis
- Lameness
- Ovarian Cysts

## Cluster 5

## UMAP & HDBSCAN

More information: Matzhöld et al. (2021) A systematic approach to analyse the impact of farm-profiles on bovine health. Science Reports 11, 21152

# Results: Logistic regression

| Disease          | F1 Score | Precision | Recall |
|------------------|----------|-----------|--------|
| Anestrus         | 0,739    | 0,763     | 0,729  |
| Lameness         | 0,737    | 0,780     | 0,700  |
| Ovarian cysts    | 0,616    | 0,675     | 0,543  |
| Ketosis          | 0,521    | 0,651     | 0,437  |
| Metritis         | 0,549    | 0,677     | 0,490  |
| Hypercalcemia    | 0,482    | 0,576     | 0,420  |
| Chronic mastitis | 0,514    | 0,635     | 0,445  |
| Acute mastitis   | 0,479    | 0,656     | 0,395  |

**Precision:** probability that a predicted disease will actually be diagnosed

**Recall:** probability that an actual disease was correctly predicted

Lasser et al. 2021

Based on Efficient Cow dataset promising first results for prediction of lameness and silent heat.

# Feature category importance

Table 3. Feature category importance<sup>1</sup>

| Feature category    | Anestrus | Lameness | Ovarian cysts | Ketosis | Metritis | Periparturient hypocalcemia | Chronic mastitis | Acute mastitis |
|---------------------|----------|----------|---------------|---------|----------|-----------------------------|------------------|----------------|
| Age                 | 4.9      | 36.7     | 2.8           | 4.7     | 2.2      | 28.4                        | 7.1              | 11.3           |
| Breed               | 1.8      | 2.6      | 1.2           | 1.5     | 2.4      | 0.4                         | 0.3              | 2.5            |
| Breeding values     | 3        | 2.4      | 2.7           | 1.7     | 2.7      | 1.9                         | 4                | 2.5            |
| Diagnosis source    | 16       | 15.6     | 29.6          | 11.9    | 33.9     | 7.1                         | 18.9             | 16.3           |
| Environment         | 14.3     | 4.9      | 16.5          | 10.5    | 15.6     | 13.8                        | 19.8             | 10.1           |
| Feed                | 27.4     | 11.8     | 17.5          | 22.4    | 12.7     | 7.5                         | 18               | 19.9           |
| Housing             | 11.5     | 12.9     | 11.3          | 19      | 15.6     | 5                           | 7.4              | 13.6           |
| Husbandry           | 9.1      | 5        | 4.5           | 8.8     | 7        | 2.7                         | 6.4              | 6.4            |
| Lactation stage     | 2.7      | 1.2      | 4.7           | 16.1    | 1.8      | 28.9                        | 0.7              | 1.3            |
| Milk indicators     | 5.9      | 2        | 3.6           | 0.7     | 2.2      | 1.4                         | 10.4             | 12.5           |
| Physical indicators | 3.6      | 4.8      | 5.7           | 2.7     | 3.9      | 3                           | 7.1              | 3.7            |

<sup>1</sup>Cumulative permutation feature importance contributions for the eleven feature categories. Values are given in % of the sum of all feature importances for a given disease.

Lasser et al. 2021

## 3 methods and 2 datasets

- ... in increasing order of complexity
  - Logistic regression (with all ~120 variables)
  - Random forest
  - XGBoost (gradient boosting trees)
- ...2 different datasets
  - „all“ data (Efficient Cow dataset, Egger-Danner et al. 2017)
  - Routinely recorded data

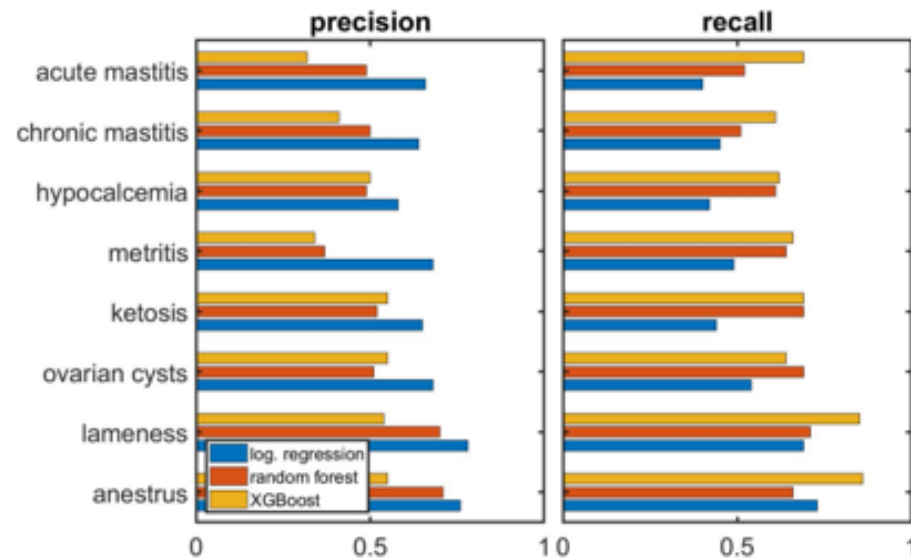

Lasser et al. (2021) Integrating diverse data sources to predict disease risk in dairy cattle – a machine learning approach. Journal of Animal Science, skab294

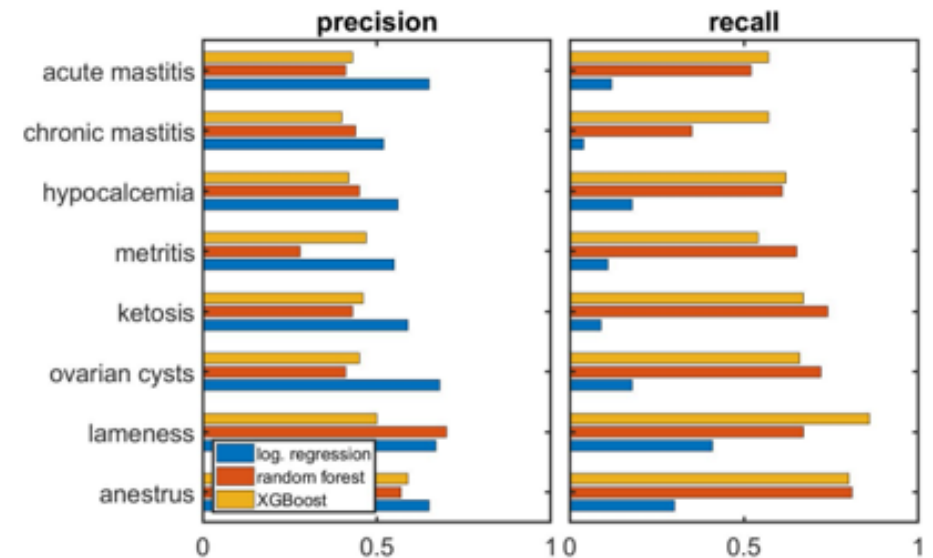

Dairy

# Results by different methods

„All“ data

Routinely recorded data

Lasser et al. 2021

**Precision:** probability that a predicted disease will actually be diagnosed

**Recall:** probability that an actual disease was correctly predicted

More complex methods perform better especially when using restricted datasets.

# Can we increase prediction by more data?

D4Dairy – complex dataset created – 2<sup>nd</sup> step

Data recording 10.2019 - 06.2021

**Data from pilot farms**  
(DHI data, diagnoses, genetic and genomic information, pedigree, MIR-predictors, .. + specifically recorded data within D4Dairy)

**Daily milk yield** from  
18,261 cows

**64,539 Lameness scores**

**64,865 Body condition scores**

**Sensor data** from  
5,439 cows

**15,421 Claw trimming data sets**

**9,161 Ketosis tests**

**Research ongoing** – aim decision support tool for early warning of diseases by data integration

## Summary and next steps

- **Cattle – many different data sources available** – complexity with technological advances increasing
- **Disease risk prediction** based on an integrative data-methodological approach in dairy cattle **is promising**
- **Challenge data integration and preparation** with highly diverse datasets!
- **Machine learning approaches of varying complexity** (from logistic regression to gradient boosted trees) **show that to some extent the complexity of the algorithm can compensate for less diverse data**
- **D4Dairy – highly integrated dataset** with animal-, farm- and other environment and management specific information set up – **research ongoing**
- **AIM: elaboration of a data-driven decision support tool for early warning** to reduce the disease risk based on highly integrated datasets

# Acknowledgement

Many thanks to farmers, veterinarians and colleagues from the partner organisations within D4Dairy for their cooperation and support.

This work was conducted within the **COMET-Project D4Dairy** (Digitalisation, Data integration, Detection and Decision support in Dairying). That is supported by BMVIT, BMDW and the provinces of Lower Austria and Vienna in the framework of COMET-Competence Centers for Excellent Technologies. The COMET program is handled by the FFG.
