European traceability system

Traceability, the key for animal breeding

Kaivo Ilves
October 24th
Who I am?

Country: Estonia
(~14400 km or 9000 miles)
CEO in performance recording organization (dairy, beef, pig)
Member of ICAR SC for Animal Identification
What is traceability?

Recording of information and ability to use this information to:
be ready to react quickly in case of disease outbreaks
reduce losses in case of disease outbreaks
European Union in general

28 member states
~4.5 million km²
~88 million bovine animals
History

Identification of cattle in milk recording herds (inventory numbers):
– ear notching
– freeze branding
– tattooing
– neck chains
– colour markers (paint)

Nonrecorded cattle were not identified.
Regulations

Ovine and caprine: Regulation (EC) 21/2004
Porcine: Directive 2008/71/EC
Equine: Regulation (EC) 2015/262

It is just a framework
How did it start?

There was a problem to solve in 1990’s!
It was called ‘BSE’ but due to that there was a need for a good traceability system.

Animal identification is just a tool in a traceability system

System to follow animals from birth to death and even from farm to fork
What was the purpose?

1. Animal health – location, trace movements in veterinary purposes.
2. Human health – to trace products and to react if needed.
3. Management of the beef and veal market.
Basic

Tagging – all animals have two tags, replacement tags.
Recording – all information must be recorded.
Database/register – animals and holdings (farms, markets, etc), quality, data capture, use of database, access to the database.
Sanctions – what happens if ...
Tagging

Two ear tags

Must be identified:
Before leaving the herd
20 days from birth

Animals outside EU
retagged
Requirements for tags

Conventional/visual tag every member state is free to decide but there are some minimum requirements.

RFID tags – electronics shall comply ISO 11784 and ISO 11785

ICAR certification of animal identification devices is required often

Registration

All holdings (farms, collection centres, market places) shall be registered in a database.

All information (tagging, movements) shall be registered within 7 days.

Passport will be issued.
Database(s)

How the data capture is organized (who and how)?
Quality of data (errors)?
Database is the heart of the system and tool for veterinary services to supervise the system.
A good database is highlighting weaknesses on the field.
Database is the tool to evaluate the quality of the system.
Sanctions

There are penalties

But even more affects farmers the chance to get less subsidies
How the system is used today?

Not only for traceability!

Farm management
Breeding
Veterinary services
Subsidies
Traceability today and near future

Trends:
  - Larger farms
  - Management systems

Technology:
  - RFIDs and readers
  - Data capture and data exchange

Challenges
  - Different farm structures and technical levels
Conclusion

The traceability doesn’t protect us against any disease outbreaks.
The traceability helps us to control the situation and it helps us to reduce losses.
Thank you and enjoy the week of ICAR 2016!
