

# Vetstat - monitoring of antimicrobial consumption

**Nana Dupont<sup>1</sup>; Helle Stege<sup>1</sup>**

*<sup>1</sup>Department of Large Animal Sciences, University of Copenhagen,  
Grønnegårdsvej 2, 1870 Frb-C, Denmark*

## Outline

- Vetstat- structure and content
- Quantification of drug consumption
- Antimicrobial use for Danish cattle- 2007 to 2011

## A brief introduction to Vetstat

Growing concern regarding antimicrobial resistance

WHO recommendation to monitor antimicrobial consumption

Vetstat initiated in 2000

## A brief introduction to Vetstat

### Vetstat aims:

- To monitor veterinary usage of drugs in animal production
- To help practitioners in their work as farm advisors
- To provide transparency as a basis for ensuring compliance with rules and legislation
- To provide data for pharmaco-epidemiological research

## A brief introduction to Vetstat

### Vetstat aims:

- To monitor veterinary usage of drugs in animal production
- To help practitioners in their work as farm advisors
- To provide transparency as a basis for ensuring compliance with rules and legislation
- To provide data for pharmaco-epidemiological research

It-based relational database

Owned and managed by the Ministry of Food, Agriculture and Fisheries.

## Brief facts on Denmark

- National herd register

## Brief facts on Denmark

- National herd register

- All antimicrobials are prescription-only

## Brief facts on Denmark

- National herd register

- All antimicrobials are prescription-only
- Legislation to curb antimicrobial use

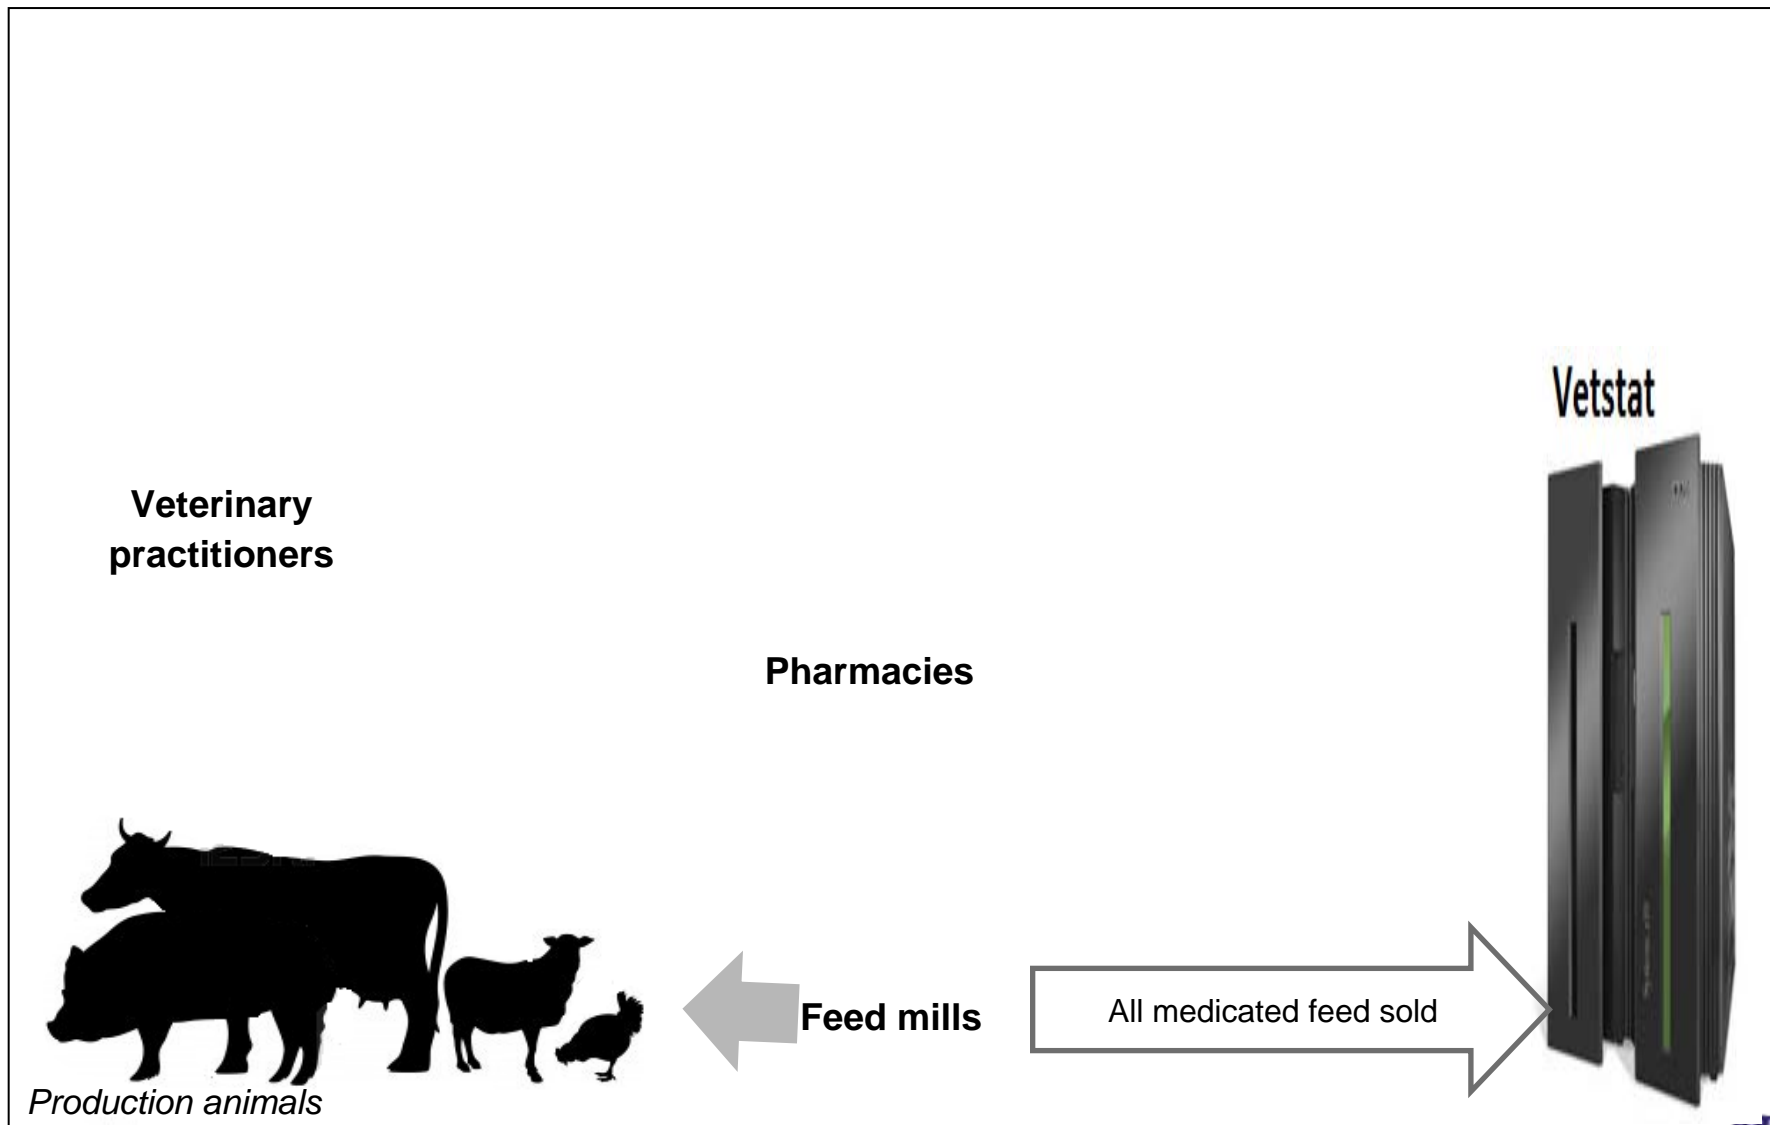

**Veterinary  
practitioners**

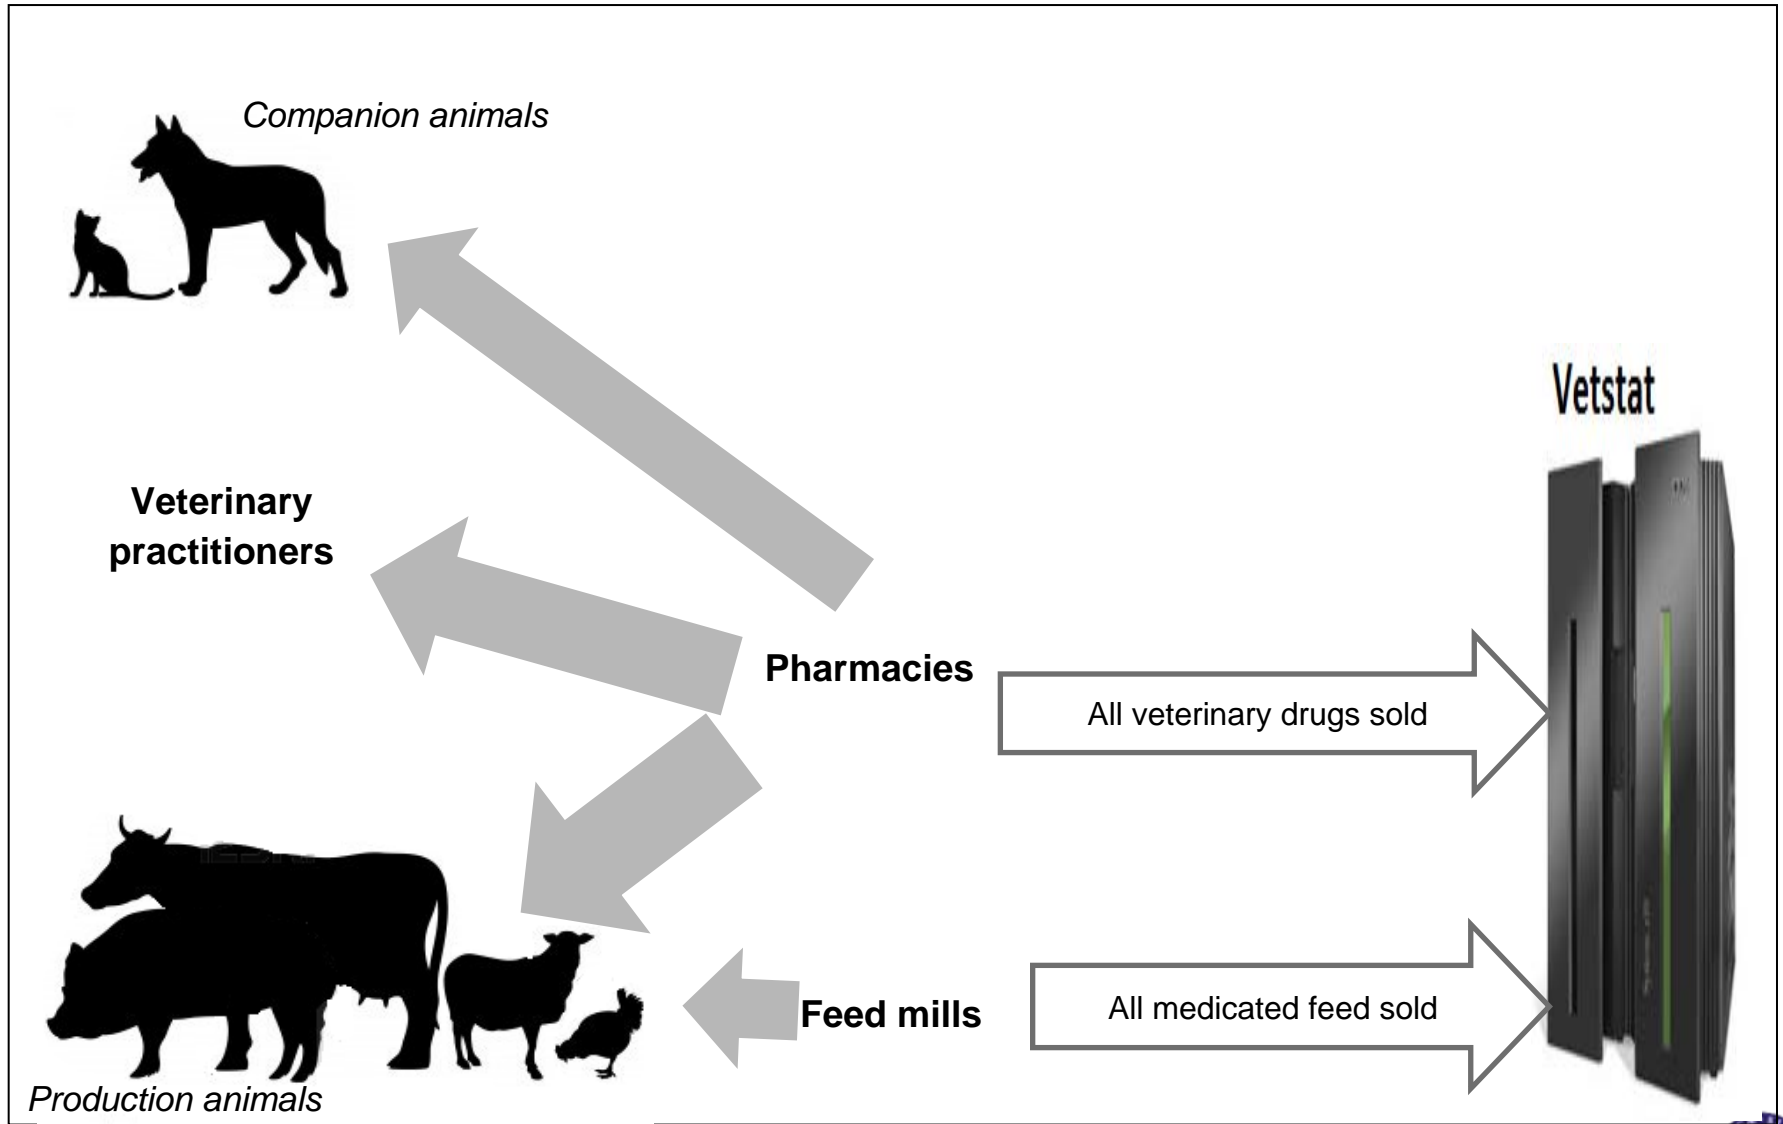

**Pharmacies**

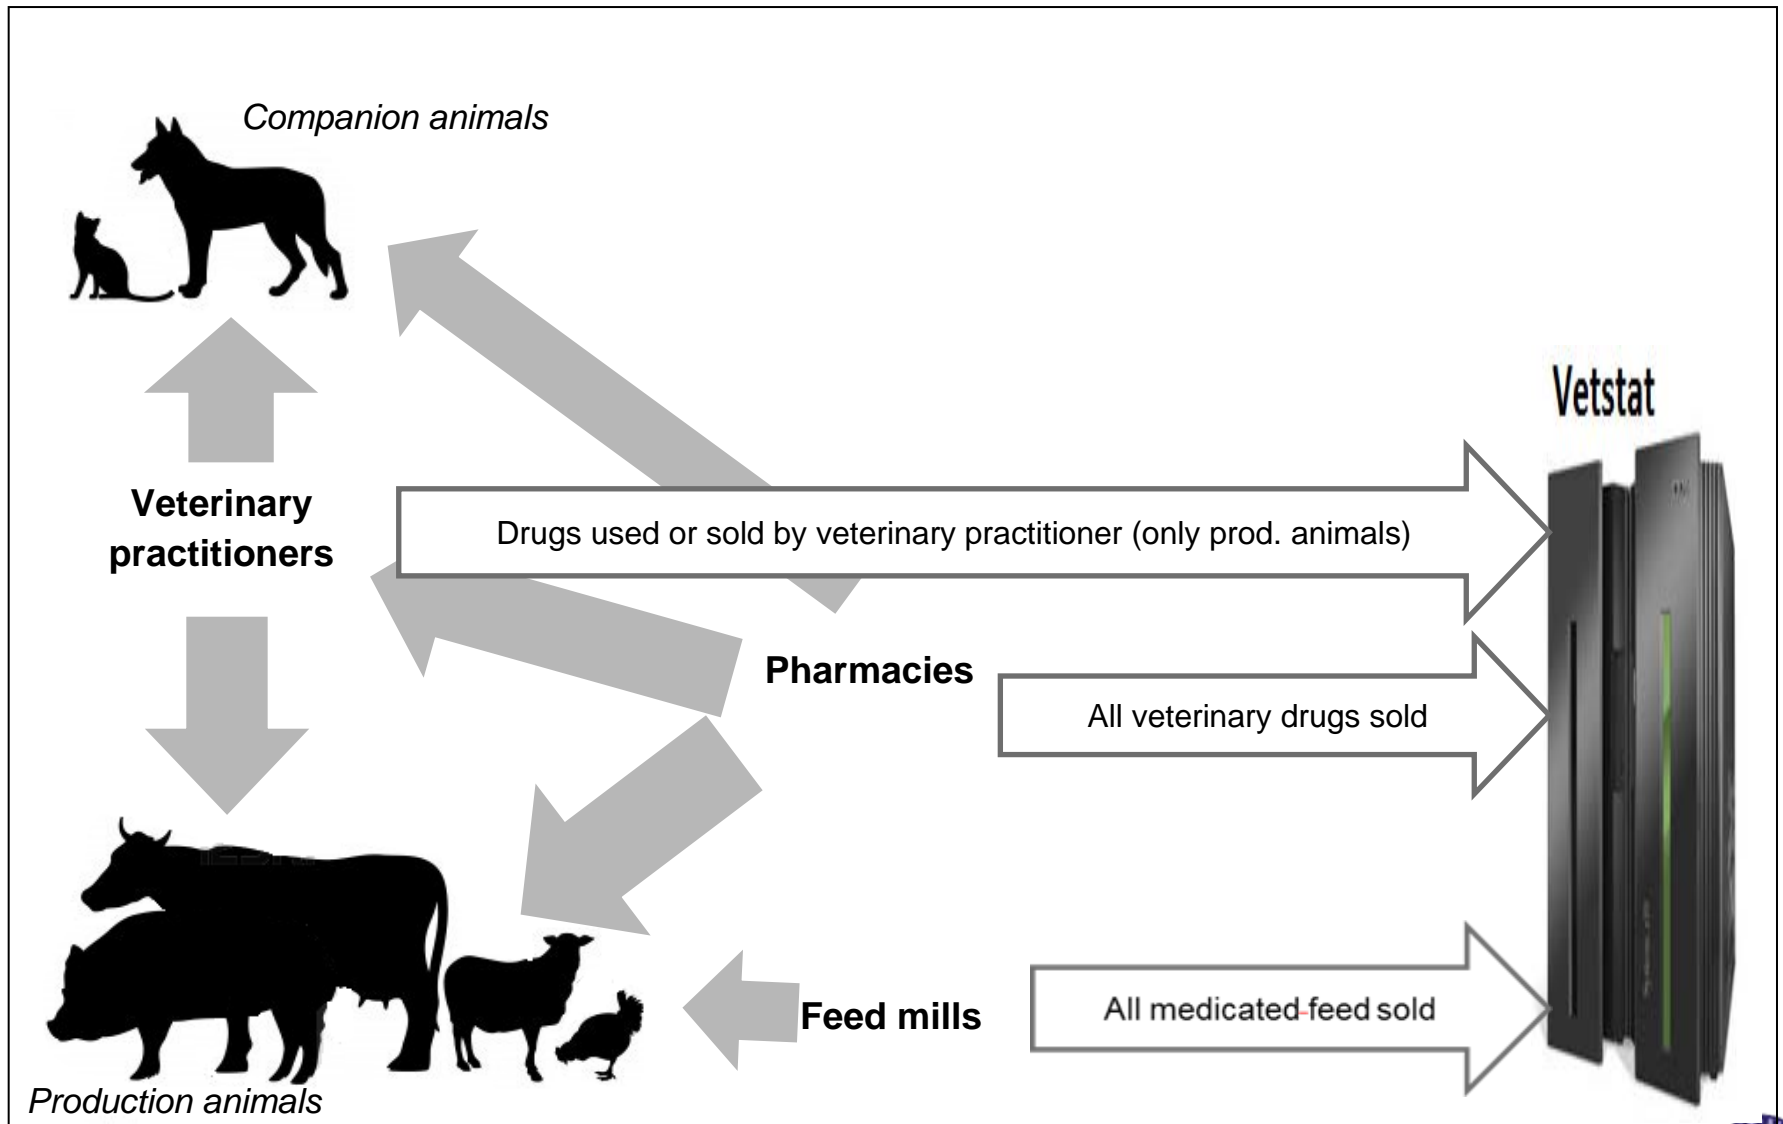

**Feed mills**

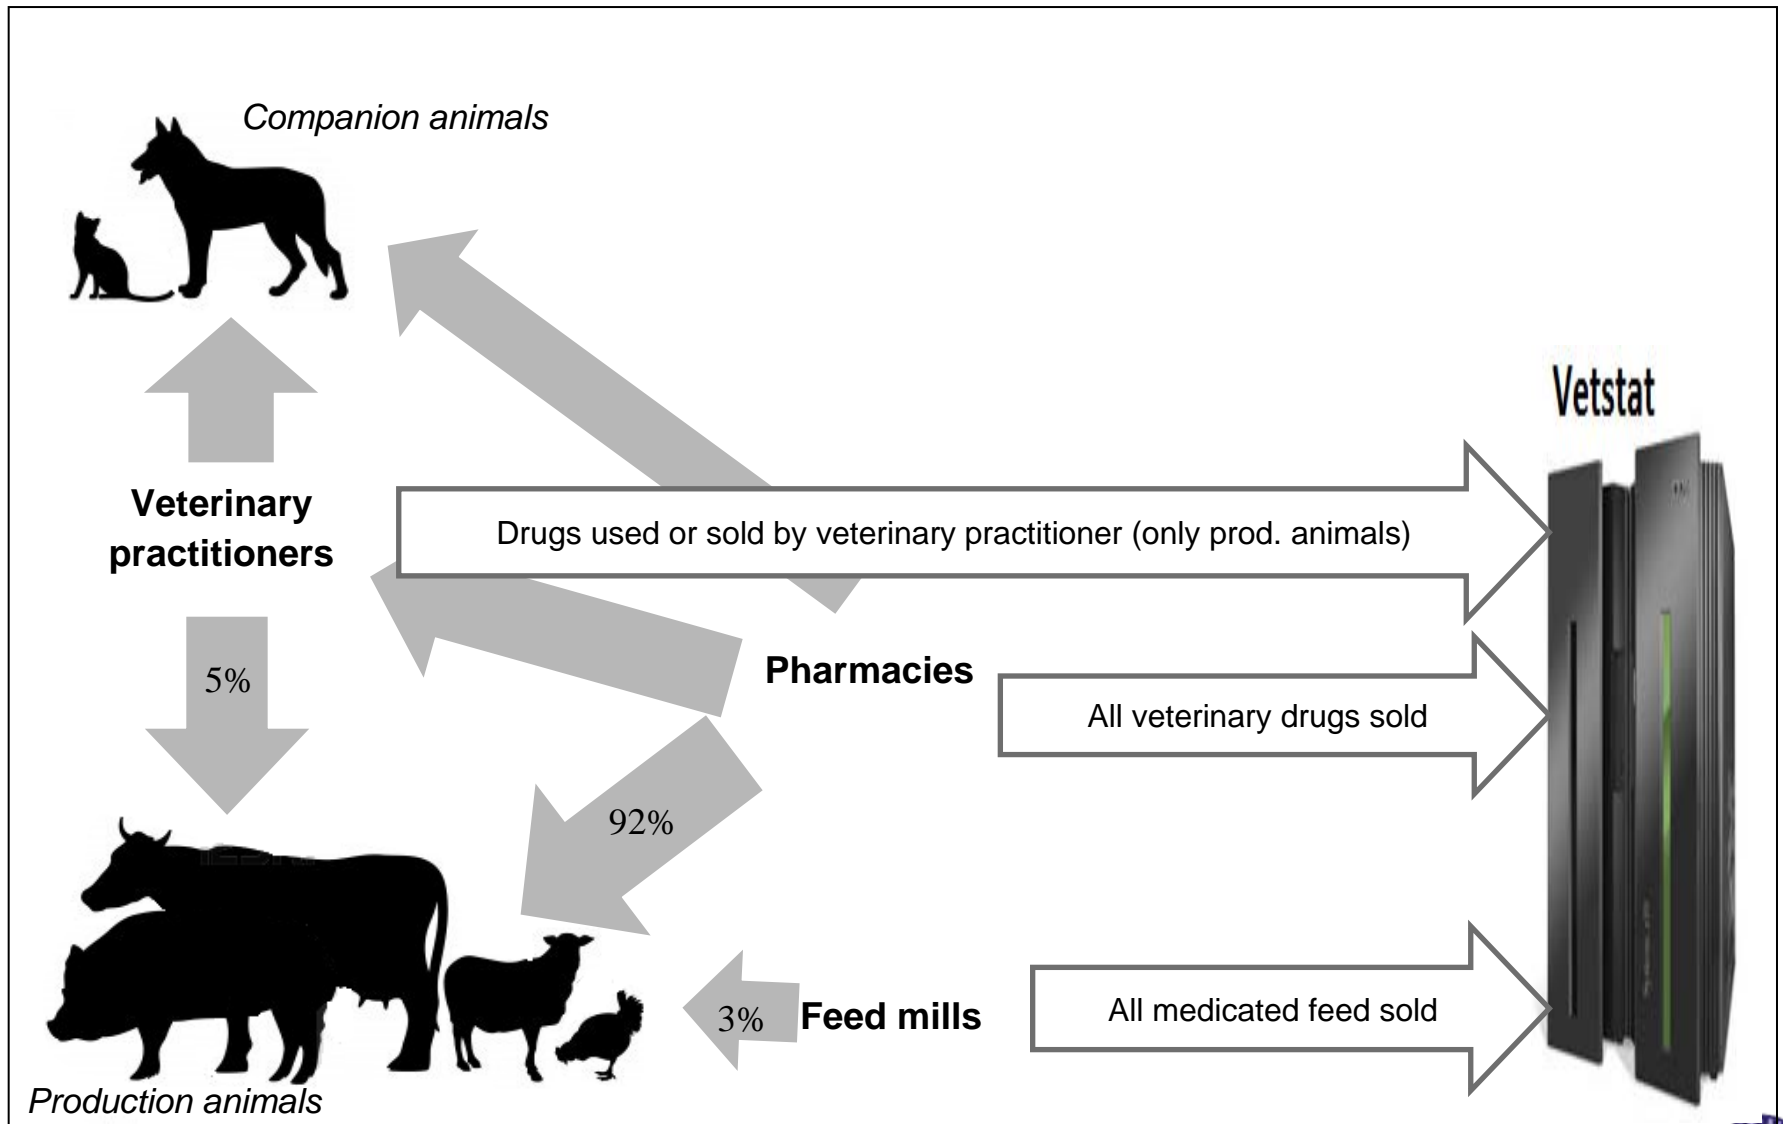

**Vetstat**

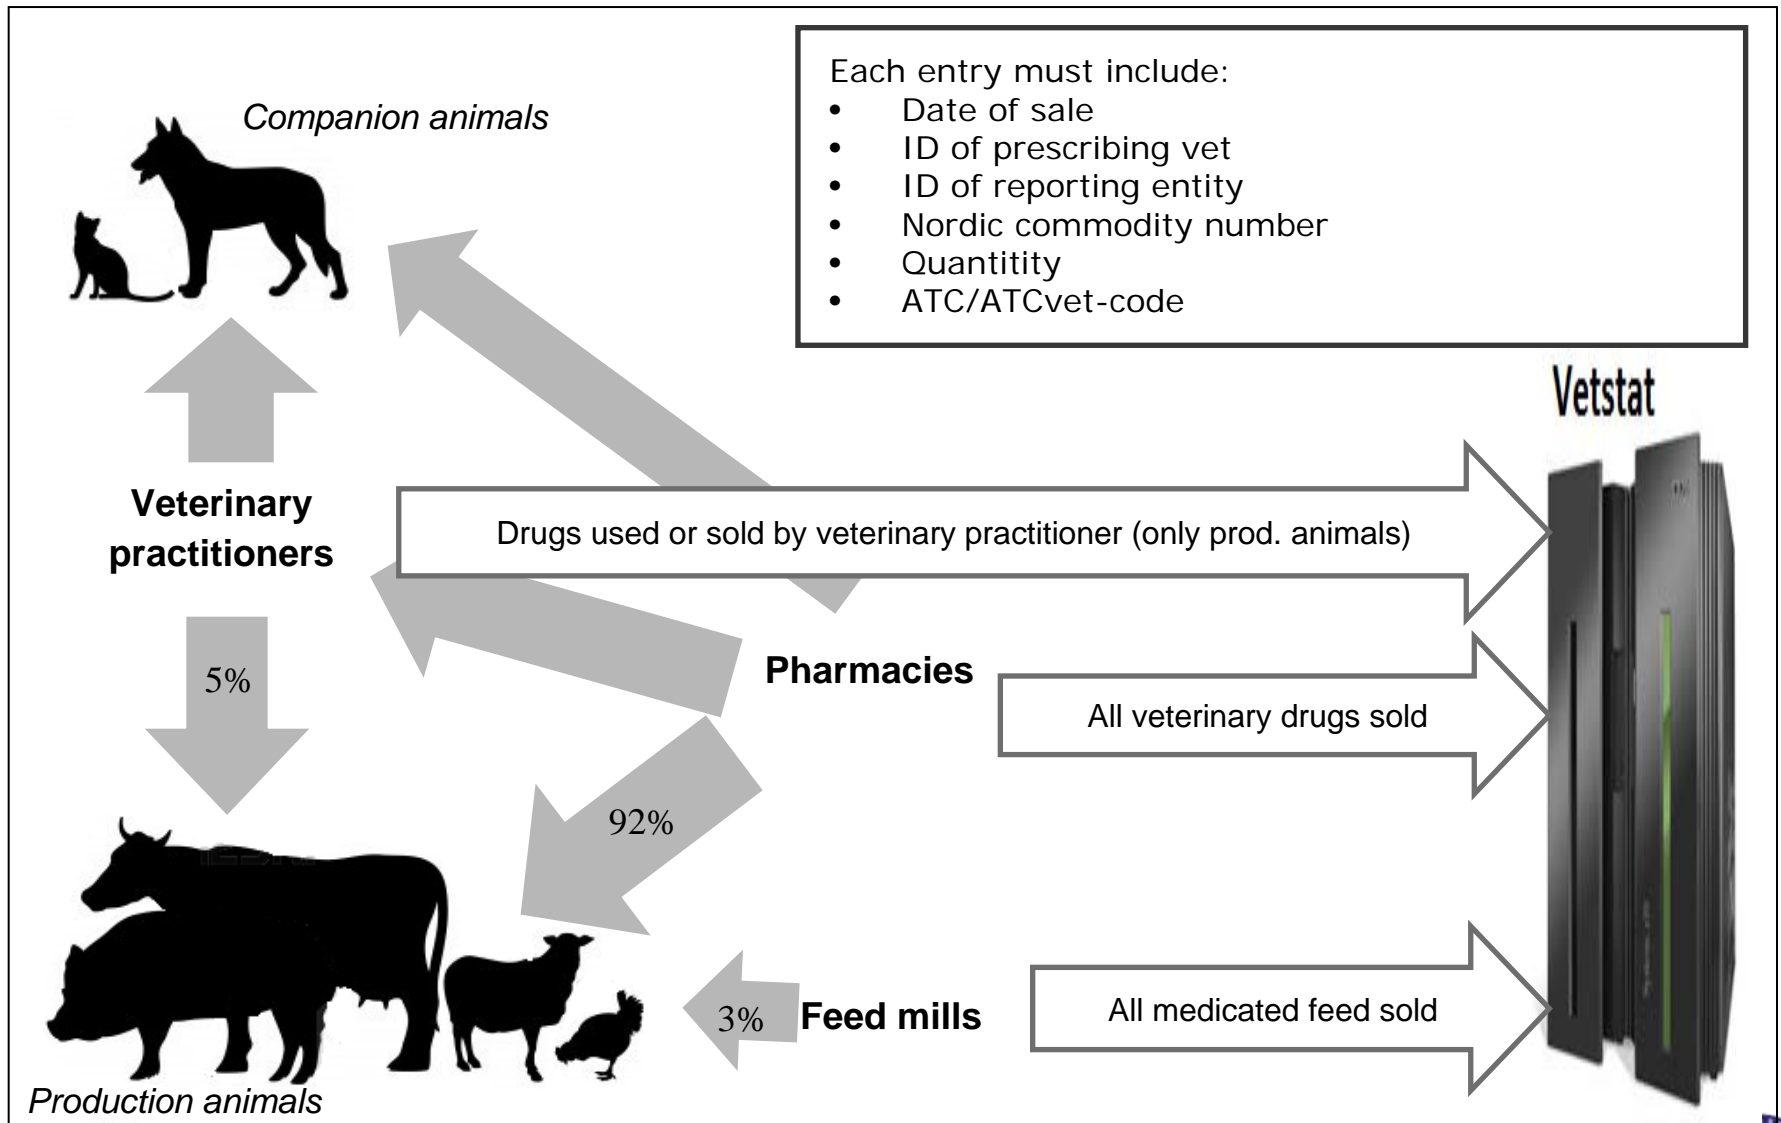

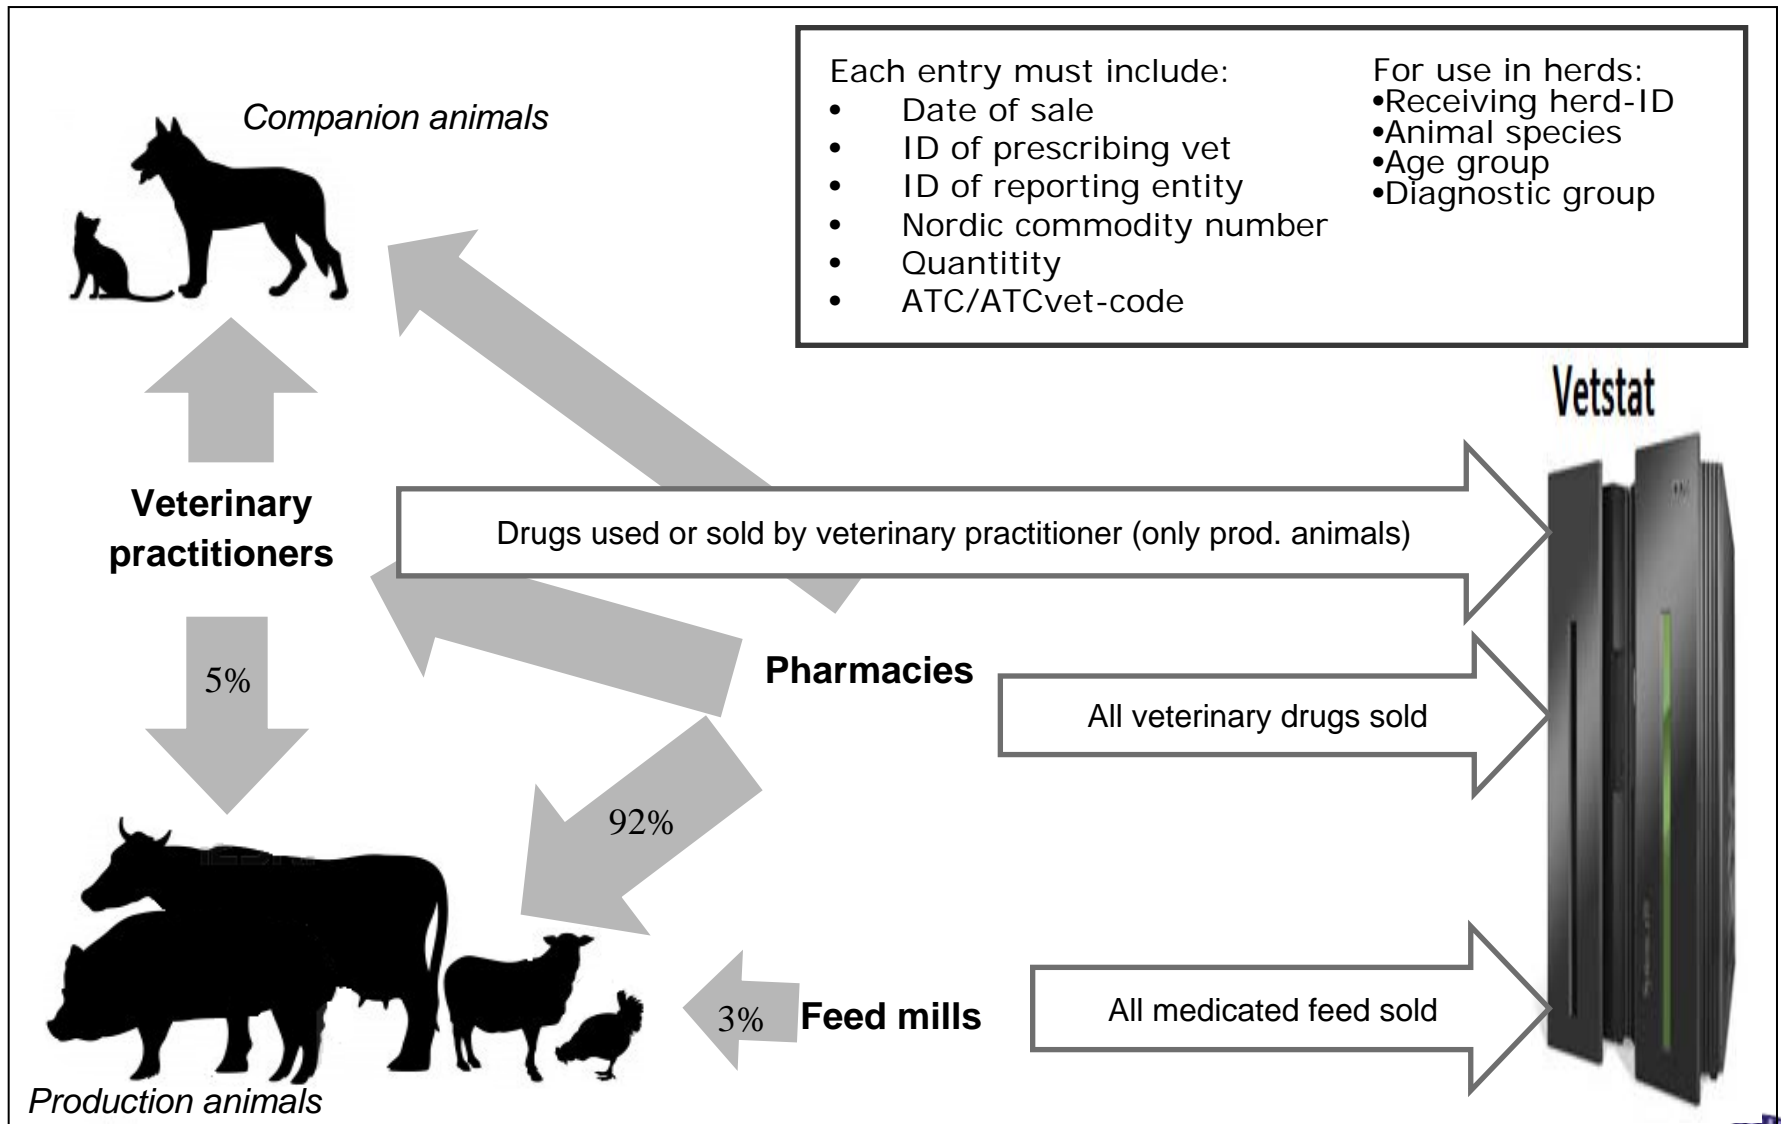

## Cattle - age groups in Vetstat

- Cows and bulls
- Calves < 12 months
- Heifers and steers > 12 months

## User-access to Vetstat data

- National consumption presented by the Ministry of Food, Agriculture and Fisheries
- Vetstat.dk – detailed data
- Since spring 2012 public access

## Potential pitfalls

- No automatic linking species/age/diagnostic group – 1.4% in 2011 (1405/100.021 entries)

## Potential pitfalls

- No automatic linking species/age/diagnostic group – 1.4% in 2011 (1405/100.021 entries)
- Incorrect ID of prescribing veterinarian

## Potential pitfalls

- No automatic linking species/age/diagnostic group – 1.4% in 2011 (1405/100.021 entries)
- Incorrect ID of prescribing veterinarian
- Lacking registrations by veterinary practitioners - estimated 10% in 2011

# Quantification of drug consumption

**Kg active compound**

# Quantification of drug consumption

## Kg active compound

- $\div$  potency

## Quantification of drug consumption

### Kg active compound

- $\div$  potency

### Animal Daily Doses (ADD)

- Daily maintenance dose per live animal for the main indication

$$ADD = \frac{\text{Total amount of active compound AM sold/used(mg)}}{\text{dosage pr kg live animal(DMDkg)} * \text{standard weight of animal}}$$

## Quantification of drug consumption

### Kg active compound

- ÷ potency

### Animal Daily Doses (ADD)

- Daily maintenance dose per live animal for the main indication

$$ADD = \frac{\text{Total amount of active compound AM sold/used(mg)}}{\text{dosage pr kg live animal(DMDkg)} * \text{standard weight of animal}}$$

- ÷ population

## Quantification of drug consumption

### Kg active compound

- $\div$  potency

### Animal Daily Doses (ADD)

- Daily maintenance dose per live animal for the main indication

$$ADD = \frac{\text{Total amount of active compound AM sold/used(mg)}}{\text{dosage pr kg live animal(DMDkg)} * \text{standard weight of animal}}$$

- $\div$  population

### Animal Daily Doses per 100 animals per day

$$ADD \text{ pr } 100 \text{ animals pr day} = \frac{ADD \text{ used}}{\text{number of pen places} * \text{days}}$$

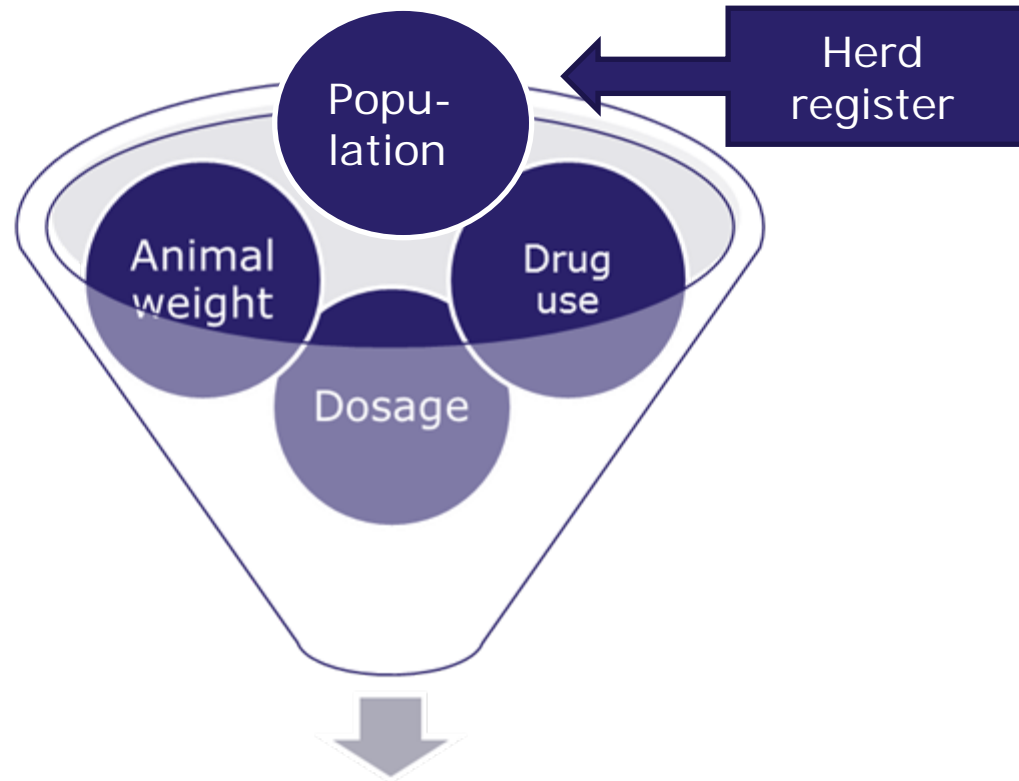

## ADD per 100 animals per day

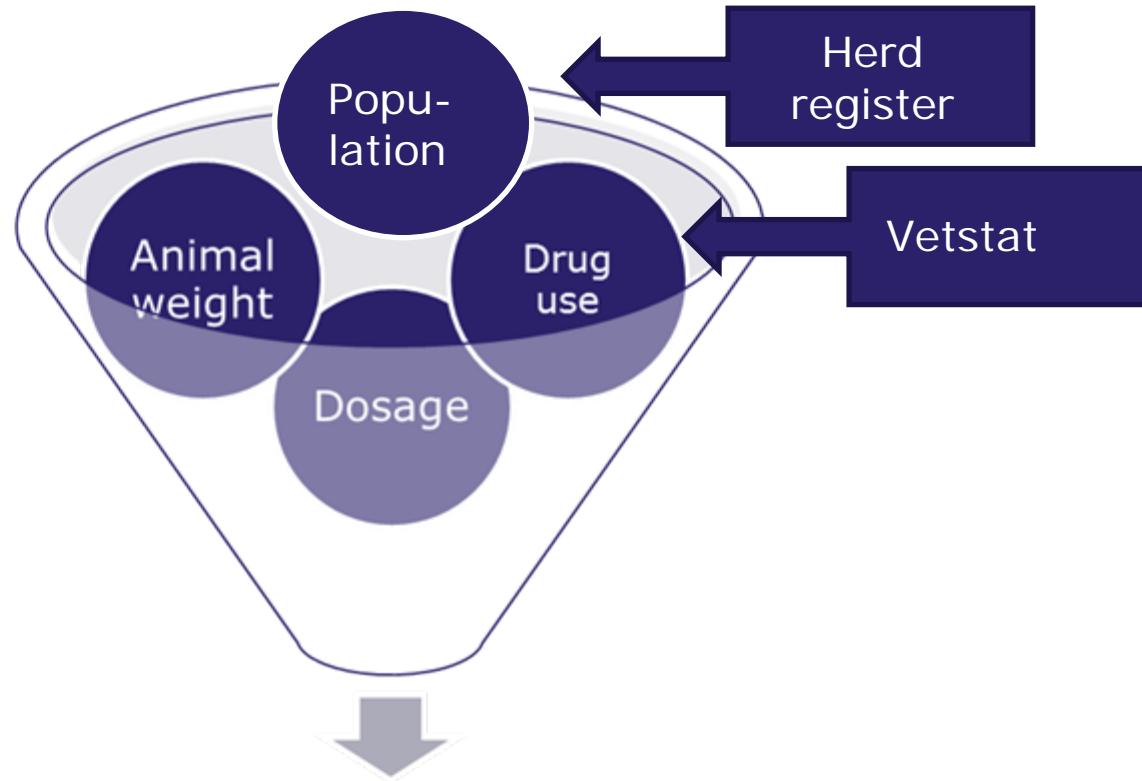

Animal Daily Doses (ADD) per 100 animals per day

## ADD per 100 animals per day

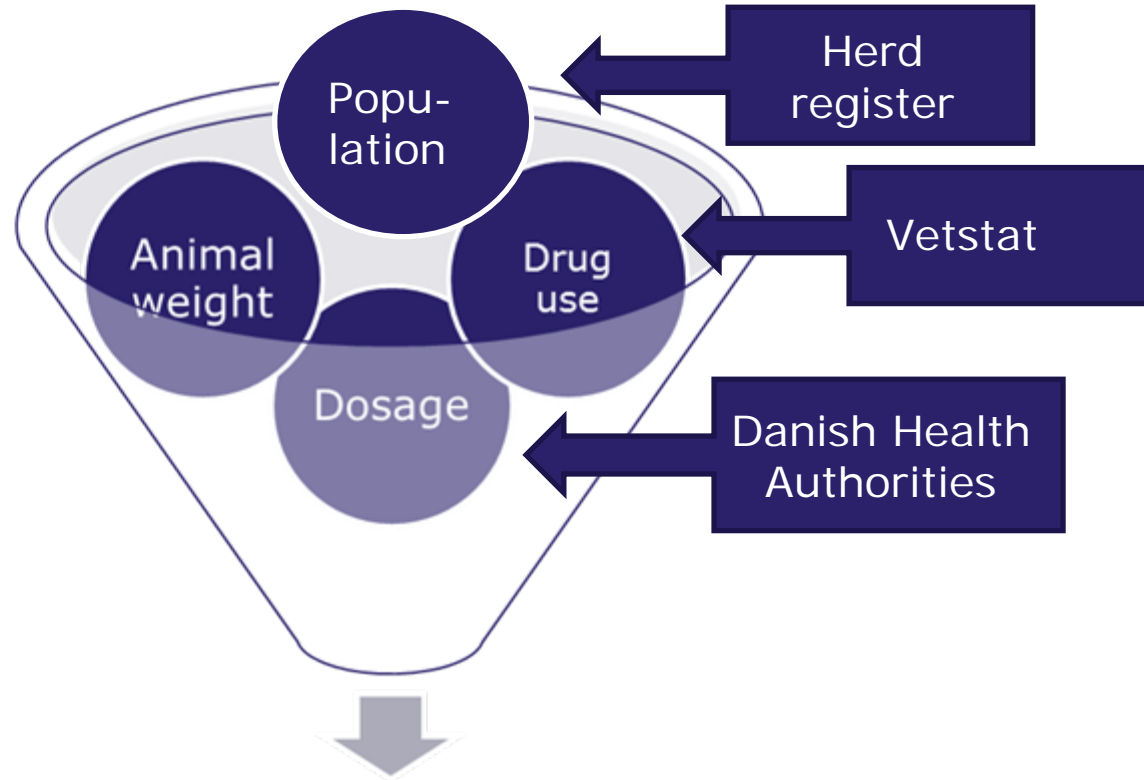

Animal Daily Doses (ADD) per 100 animals per day

## ADD per 100 animals per day

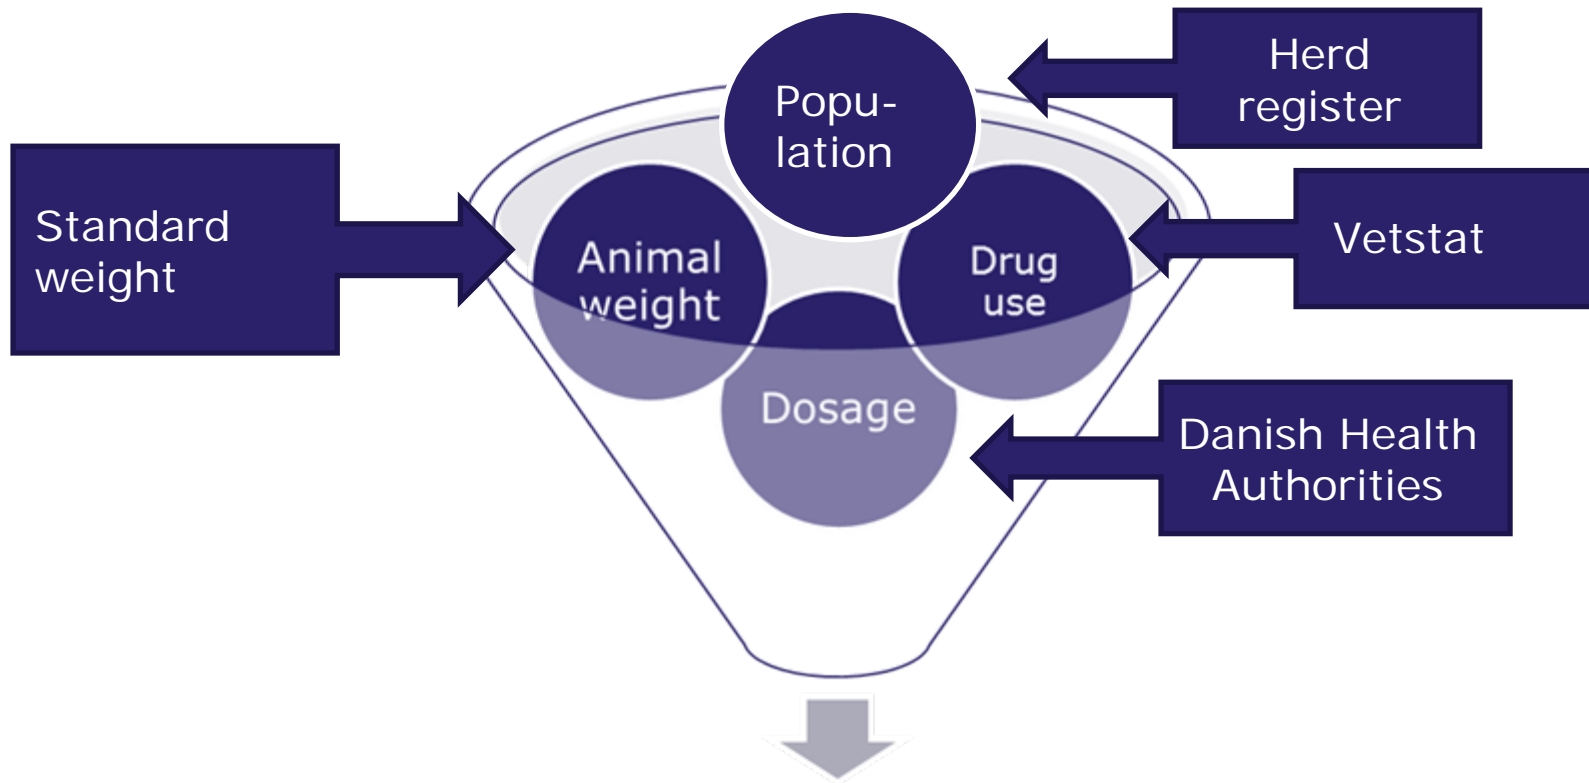

Animal Daily Doses (ADD) per 100 animals per day

## ADD per 100 animals per day

Animal Daily Doses (ADD) per 100 animals per day

## ADD per 100 animals per day

Animal Daily Doses (ADD) per 100 animals per day

## Quantification of drug consumption- animal weight

Age group	Standard weight
Cows, bulls	600 kg
Calves <12 months	100 kg
Heifers, steers > 12 months	300 kg

## Quantification of drug consumption- animal weight

Age group	Standard weight
Cows, bulls	600 kg
Calves <12 months	100 kg
Heifers, steers > 12 months	300 kg

Age group → large effect on ADD

## Calculation examples

### ADD

100 mL EthacilinVet - 300 mg benzylpenicillinprocain/mL

for treatments of cows (15mg/kg)

$$ADD = \frac{(100\text{mL product} * 300\text{mg/mL})}{15\text{mg/kg} * 600\text{kg}} = 3,33ADD$$

## Calculation examples

### ADD

100 mL EthacilinVet - 300 mg benzylpenicillinprocain/mL

for treatments of cows (15mg/kg)

$$ADD = \frac{(100\text{mL product} * 300\text{mg/mL})}{15\text{mg/kg} * 600\text{kg}} = 3,33ADD$$

### ADD per 100 animals per day

150 ADDs (cows/bulls) for herd with 400 pen places in January (31 days)

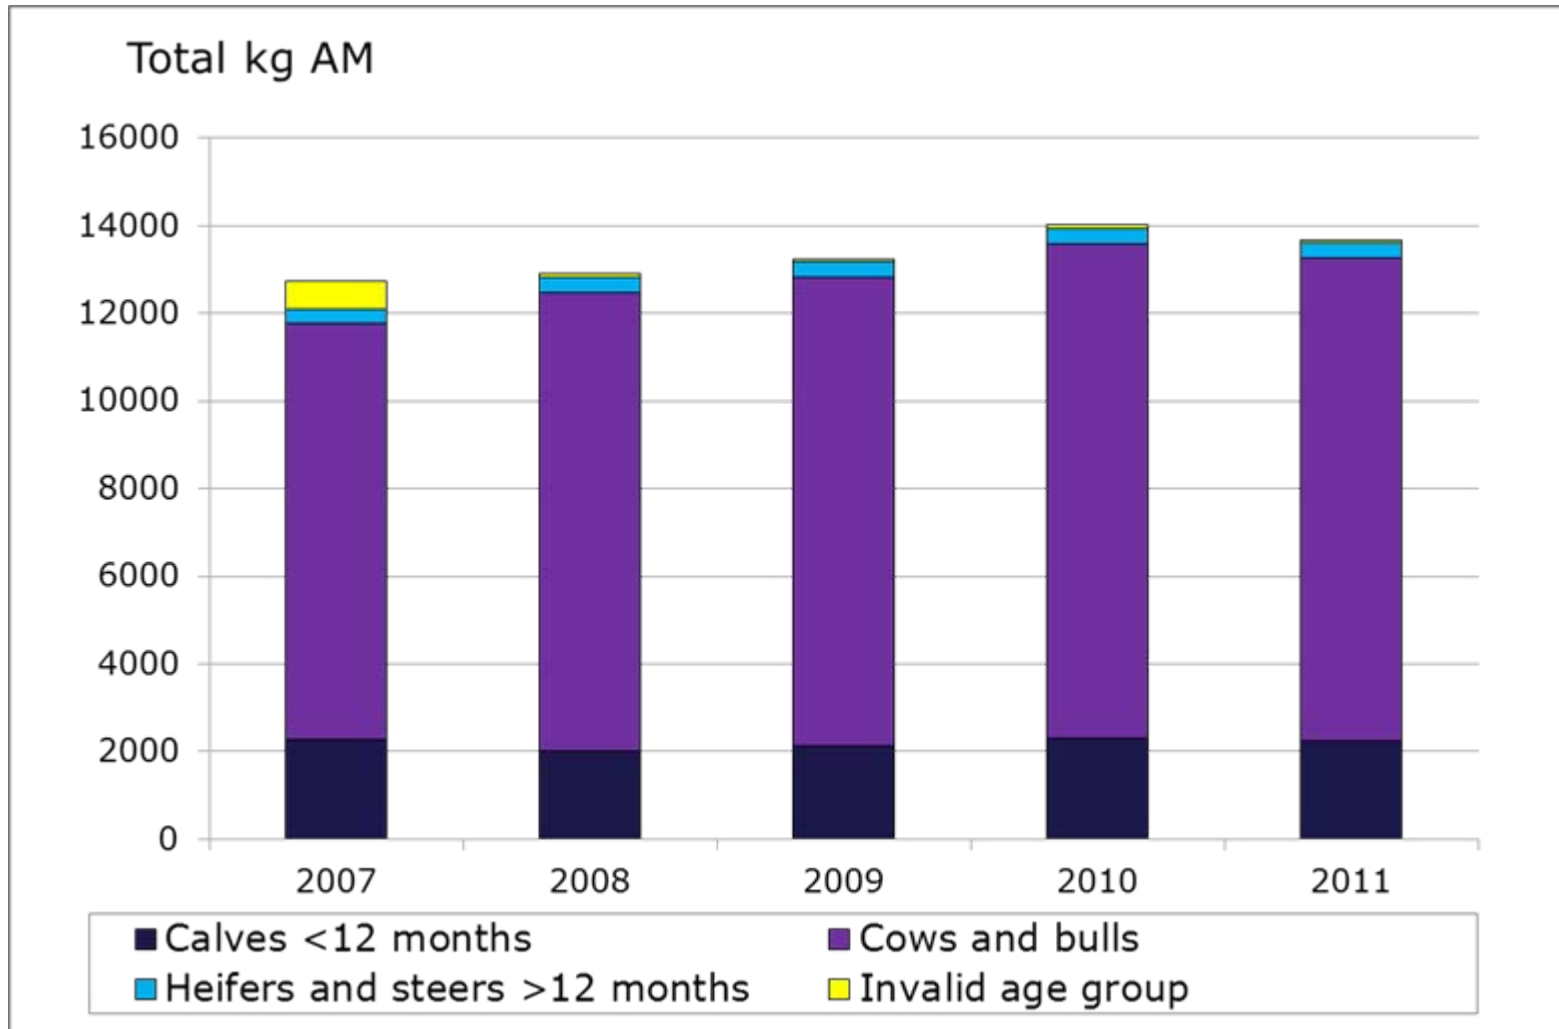

$$ADD \text{ pr } 100 \text{ animals pr day} = \frac{150 \text{ ADD used}}{400 \text{ pen places} * 31 \text{ days}} * 100 = 1.2$$

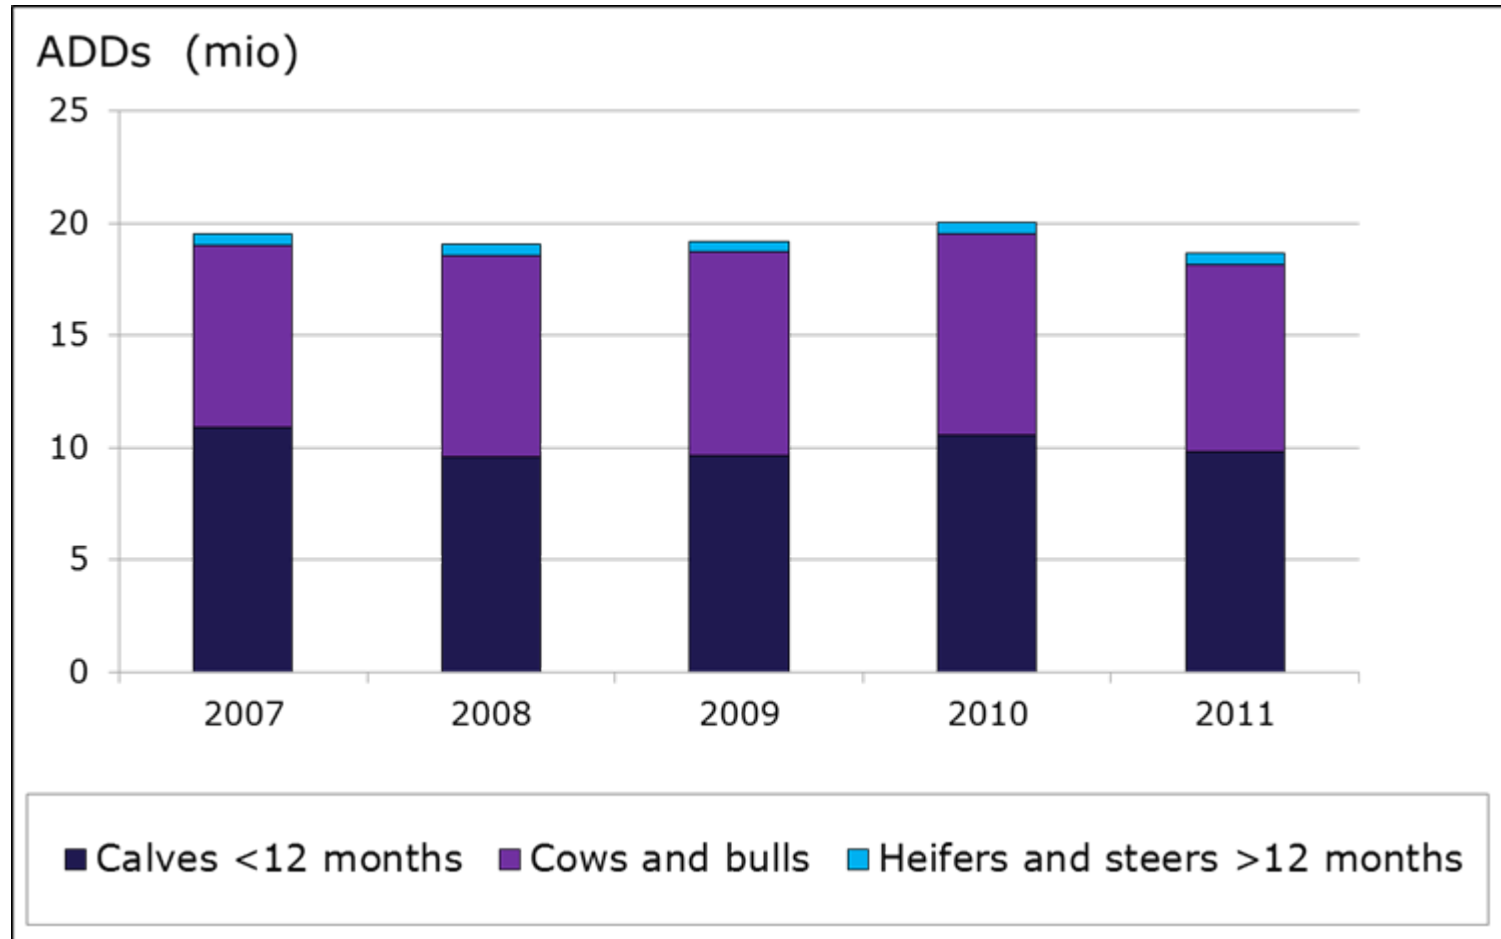

## Antimicrobial consumption in Danish cattle

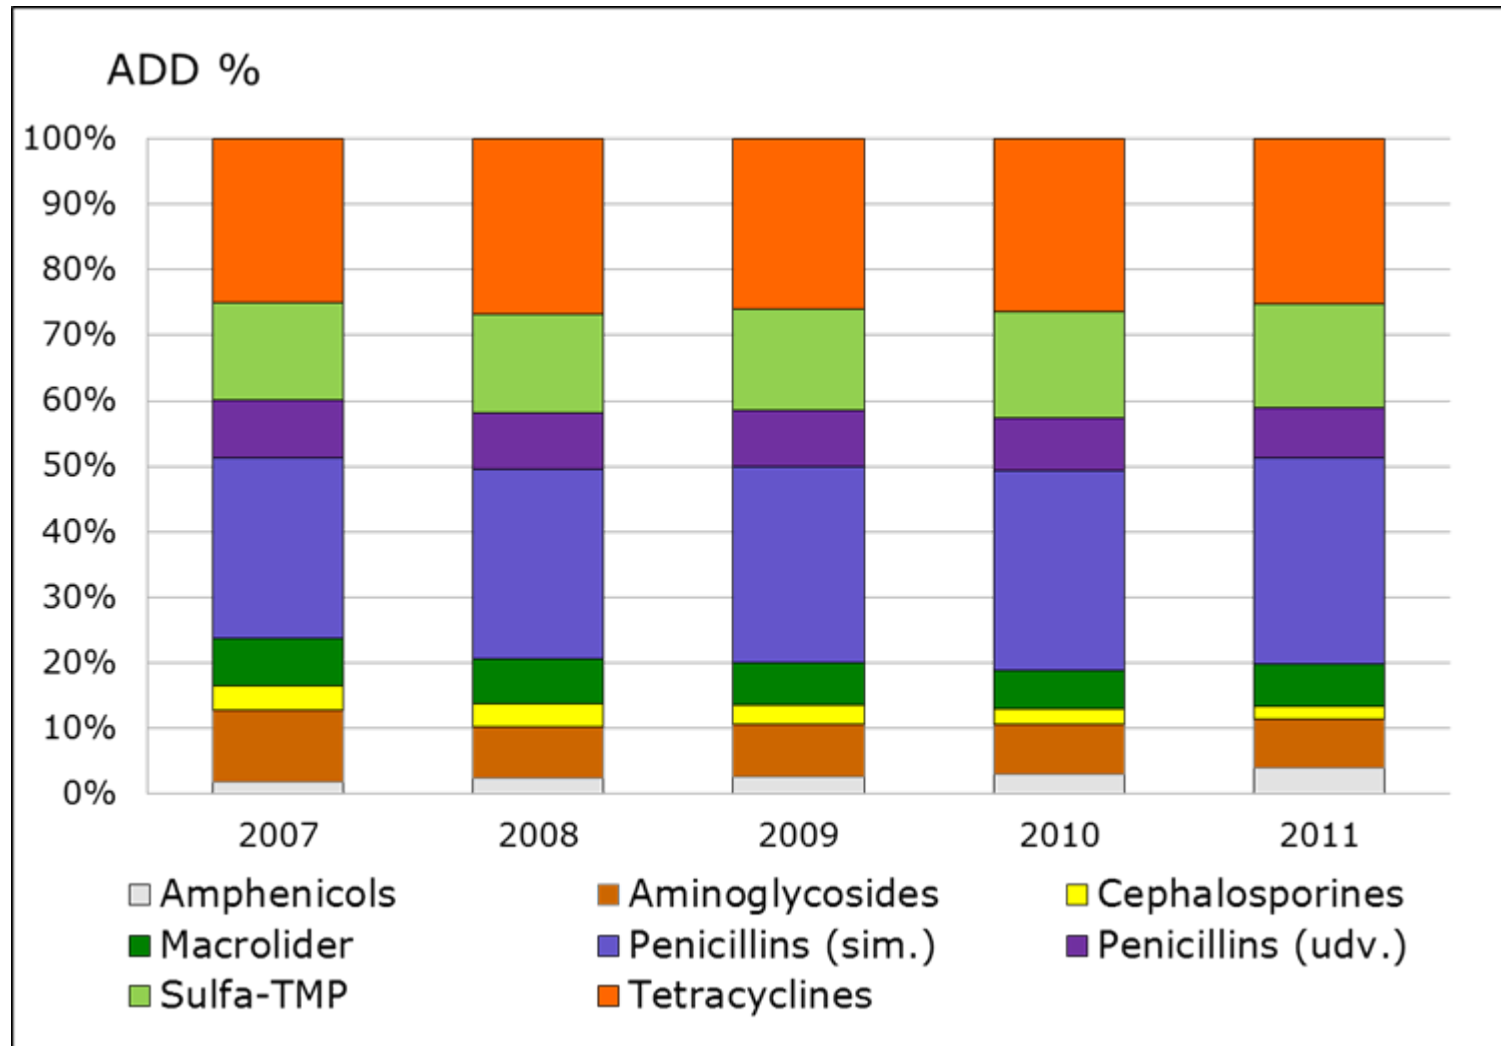

## Antimicrobial consumption in Danish cattle

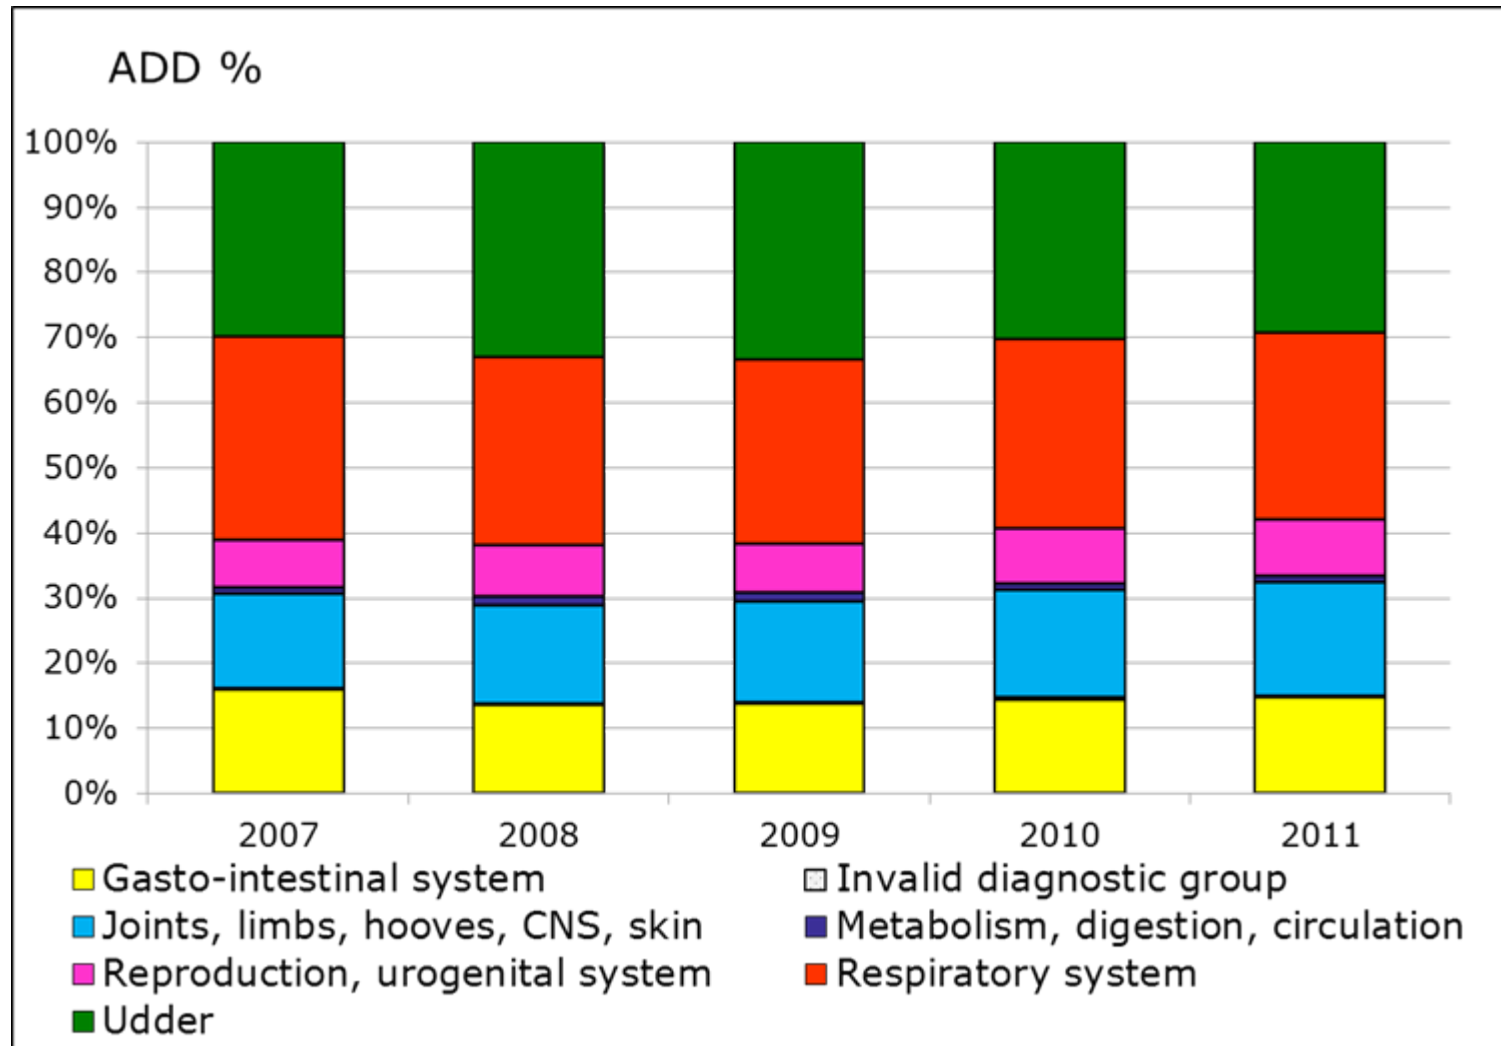

## Antimicrobial consumption in Danish cattle

## Antimicrobial consumption in Danish cattle

## Antimicrobial consumption in Danish cattle

## Effect of number of animals

To evaluate consumption, one needs to know the number of animals "available for treatment" – or at least some estimate of the population size

### Objective:

To describe the consequences of using three different ways to measure number of animals when reporting the yearly antimicrobial consumption

## Effect of number of animals

### Animal population measurements

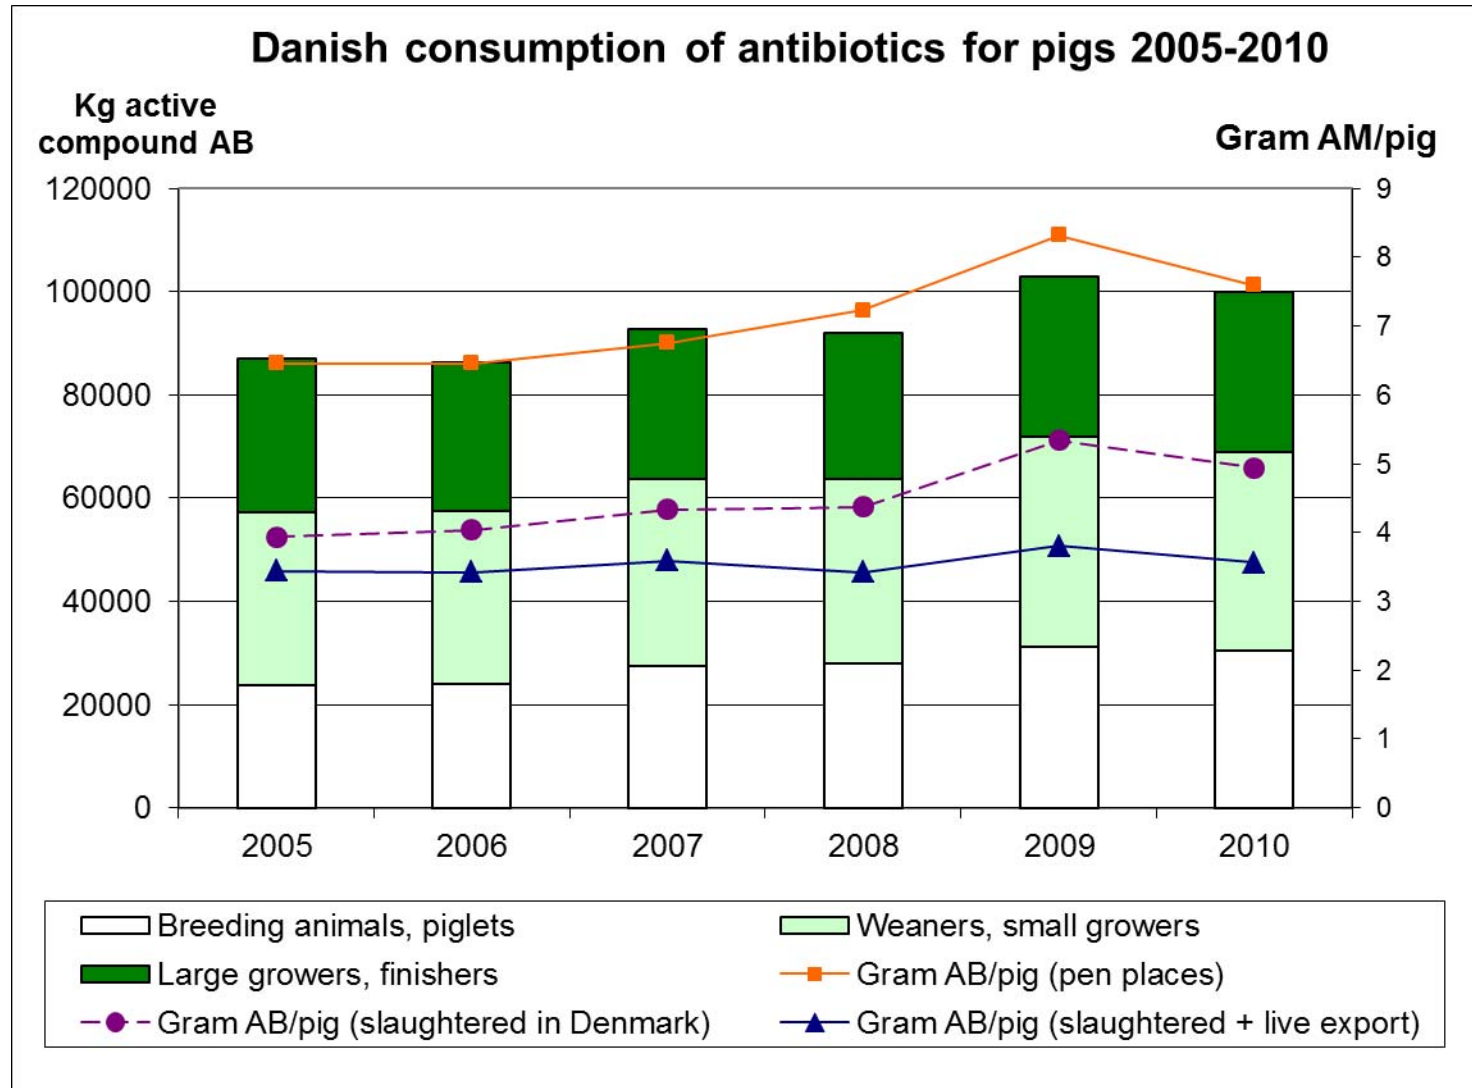

- Number of pen places
- Number of pigs slaughtered in Denmark (~ 2 x pen places)
- Number of pigs slaughtered in Denmark + number of exported growers (~30 kg) and finishers

## Effect of number of animals – reporting consumption

## Effect of number of animals – reporting consumption

## Trends in live export

## Effect of number of animals

- Difficult to make accurate numbers on animal population per year
- Important to take export into account
  - ~ 95% of all growers exported  $\geq 30$  kg
  - Not including exports  $\rightarrow$  skewed result in comparisons.
- When reporting the antimicrobial consumption per pig, it might be prudent always to describe exactly how "number of pigs" are being calculated

## In conclusion

- Great opportunity to assess AM usage both at a national level and a herd level
- Caution when interpreting Vetstat data

## In conclusion

- Great opportunity to assess AM usage both at a national level and a herd level.
- Caution when interpreting Vetstat data
- Consider:
  - potential erroneous data

## In conclusion

- Great opportunity to assess AM usage both at a national level and a herd level.
- Caution when interpreting Vetstat data
- Consider:
  - potential erroneous data
  - lacking registrations

## In conclusion

- Great opportunity to assess AM usage both at a national level and a herd level.
- Caution when interpreting Vetstat data
- Consider:
  - potential erroneous data
  - lacking registrations
  - effect of calculation methods

## In conclusion

- Great opportunity to assess AM usage both at a national level and a herd level.
- Caution when interpreting Vetstat data
- Consider:
  - potential erroneous data
  - lacking registrations
  - effect of calculation methods
  - changes in population
