

Towards a robust protocol for enteric methane measurements using a hand held Laser Methane Detector in Ruminants

Thiphaine Bruder, Benoit Rouille, Tianhai Yan, Mizeck G.G. Chagunda

Speaker: Mizeck Chagunda

Laser Methane Detector in Dairy Cows

Thiphaine Bruder, Benoit Rouille, Tianhai Yan,
Mizeck Chagunda

Why Methane?

- Methane (CH_4) is produced as part of the normal digestive process in ruminants.
- 89% of methane emitted from ruminants is produced in the rumen and exhaled through the mouth and nose
- Formed in the rumen by methanogens (archaea, protozoa, fungi and bacteria) using hydrogen and CO_2

Traditional Methods

- Respiration calorimetry chambers
- Tracer Gas Techniques
- Sniffer technologies
- Micro Met Technique

Laser Methane Detector

- Based on infrared absorption spectroscopy
- Using a semiconductor laser as a collimated excitation source
- Employs second harmonic detection of wavelength modulation spectroscopy to establish methane concentration

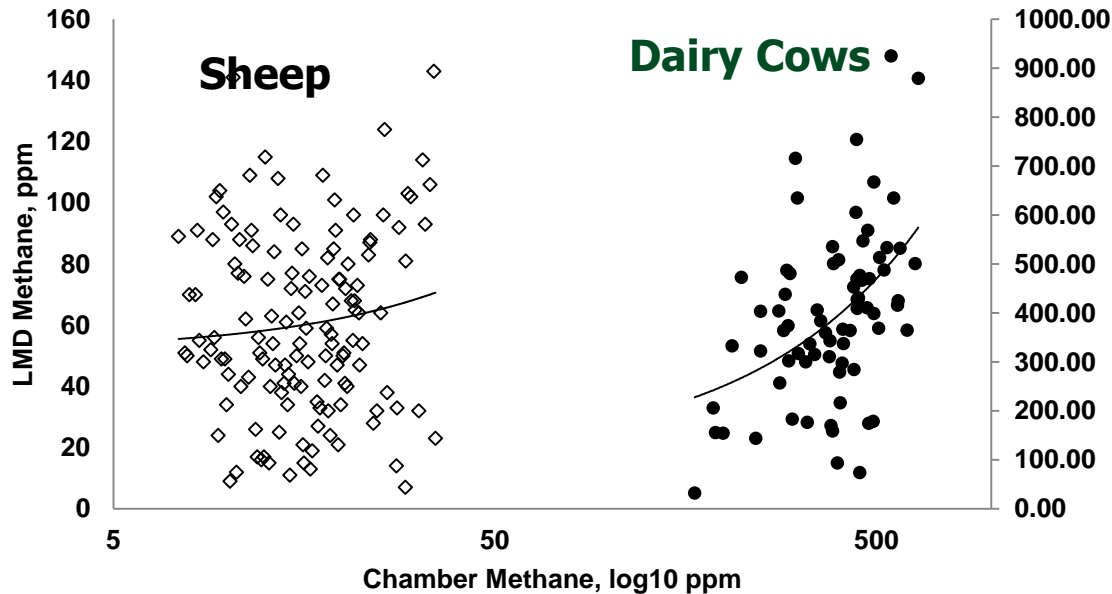

What we know so far?

Breath cycles

Correlation with the Chamber

- Sensitivity and specificity for cows were 95.4% and 96.5%.
- For sheep, sensitivity was 93.8% and specificity was 78.7%.

New Questions

- Which data do we extract?
- When should we measure?
- How long should we measure?

What data to extract?

	Raw LMD data (ppm)	Processed LMD data (ppm)	Chamber methane (ppm)	Chamber methane (g/day)
Min	0	24	12	85
Max	49287	237	177	170
Mean	125.3	114	84.7	127.8
Variance	294656.9	2020.0	519.3	240.2
SD	542.8	45	22.8	15.5

N = 44208 for LMD and 44208

Distribution of Raw LMD data

Normal Distribution Laserppm. Mean=126. SD=566

Distribution Measurement from the Laser

Distribution LMD after Outliers

Normal Distribution Laserppm. Mean=113. SD=45

Distribution 95% Measurement from the Laser

Density Distribution Chamber

Distribution of Chamberppm. Mean=85,19. SD=21,62

Distribution of the Measurement from the Chamber

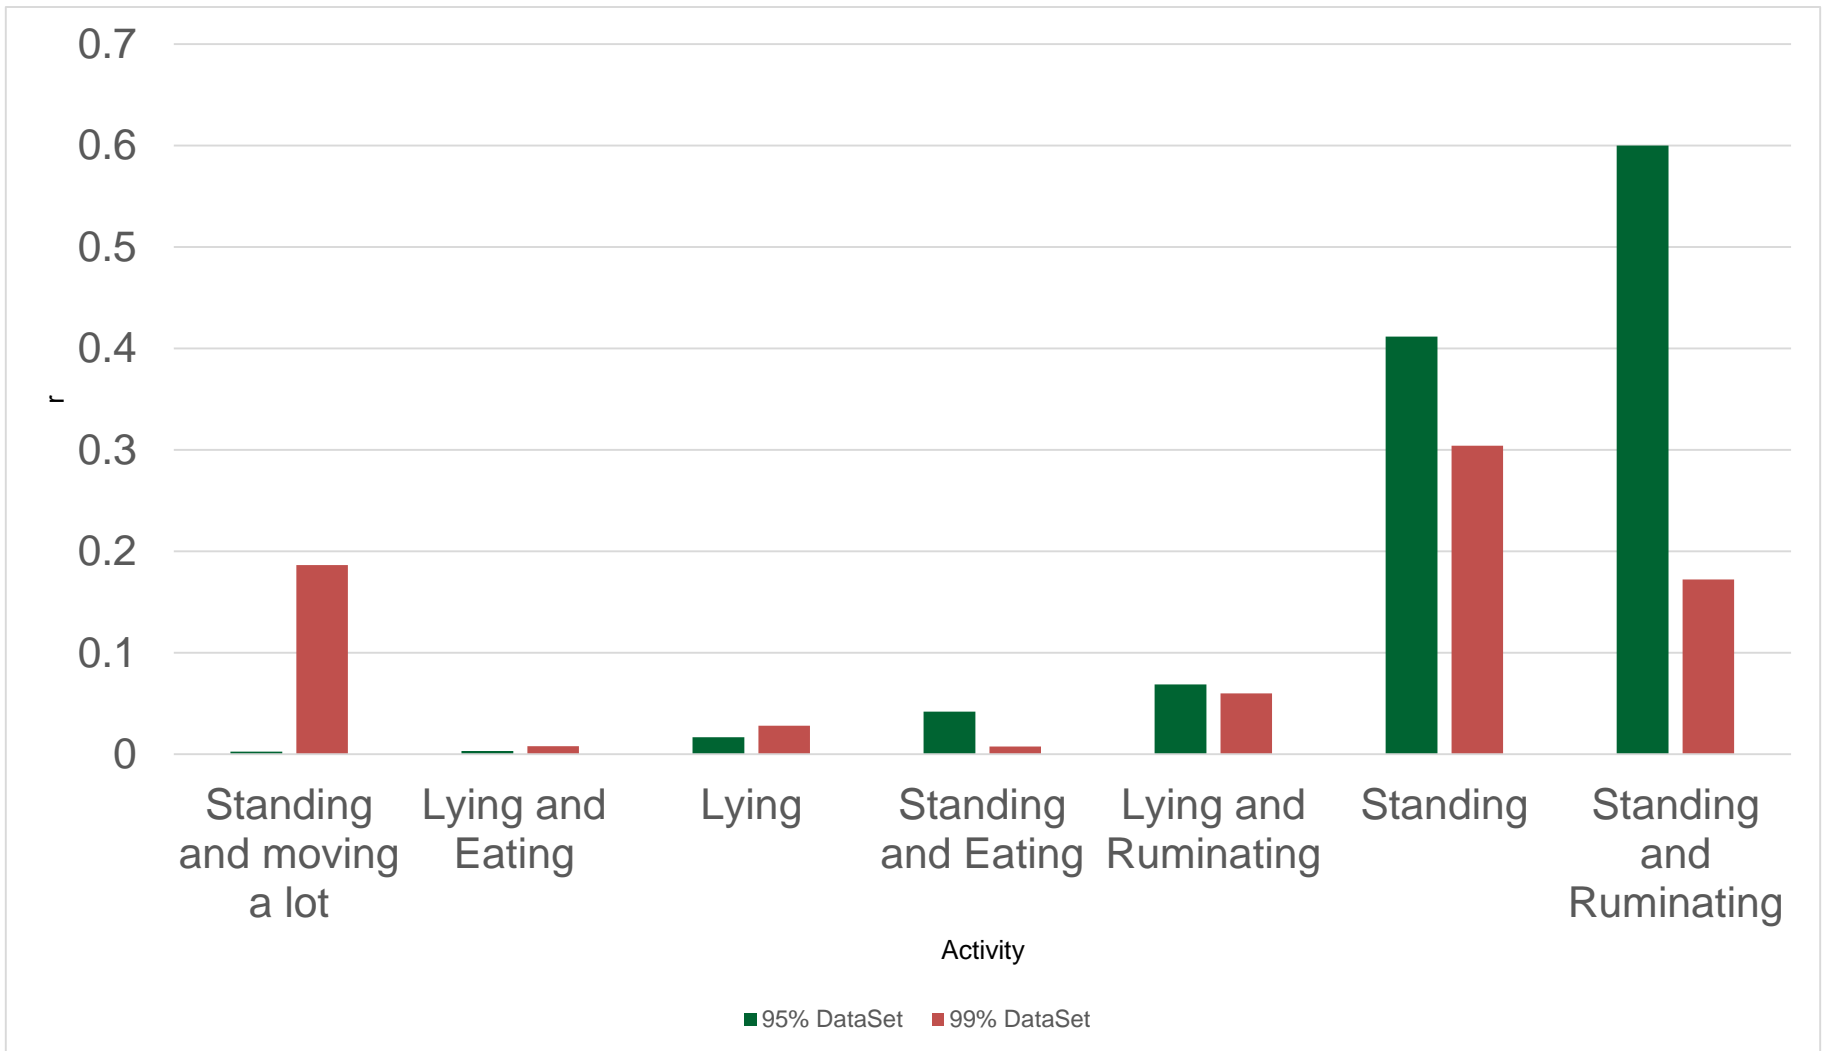

What data to extract?

	Raw LMD data (ppm)	Processed LMD data (ppm)	Chamber methane (ppm)	Chamber methane (g/day)
Min	0	24	12	85
Max	49287	237	177	170
Mean	125.3	114	84.7	127.8
Variance	294656.9	2020.0	519.3	240.2
SD	542.8	45	22.8	15.5

N = 44208 for LMD and 44208

When to measure?

How long should we measure?

- Measurement duration had a significant effect ($p < 0.01$) on the concentration of methane measured by LMD
- 60s measurements significantly low ($p < 0.001$)
- LMD measurement window of at least 3 minutes long, recommended

Relationship to g/day chamber methane

$R^2 = 0.42$ and $r = 0.65$

$$\text{Chambergday} = \frac{\text{LaserWindow} + 127.21}{2.00}$$

Conclusion

- LMD is a promising proxy for measuring enteric methane
- Need to understand the data
- Build on what we know to develop a robust protocol for measuring enteric methane using LMD.

...thank you for your attention

Relationship to conc.(ppm) chamber methane

95% LaserWindowppm vs Chamberppm

99% LaserWindowppm vs Chamberppm
