# A Veterinary Perspective on Udder Health Recording

## Focus on Clinical and Sub-clinical Mastitis

**Andrew J Bradley** MA VetMB DCHP DipECBHM PhD MRCVS  
RCVS-Recognised Specialist in Cattle Health and Production  
European Specialist in Bovine Health Management

Quality Milk Management Services Ltd, Wells Somerset UK  
School of Veterinary Medicine and Science, University of Nottingham, UK

# Introduction

- What can and should we record?
  - Challenges and Pitfalls
- Newer Technologies
- Use and interpretation

THE GLOBAL STANDARD  
FOR LIVESTOCK DATA

The University of  
**Nottingham**

# What can and should we record?

- Individual Cow Somatic Cell Counts (ICSCC)
  - Differential cell counts
  - Sub-clinical Mastitis
- Clinical Mastitis
- Aetiology
- Other measures of inflammation
  - Conductivity, CMT, *etc*
- Treatments
- Teat End Callosity Scores

# Somatic Cell Counts (1)

- At the cow level.
  - Qrt level? - technology and cost
  - Bulk tank (later)
- Recording interval
  - Can vary
    - According to farm needs?
    - Genetic evaluations should 'fit'????
  - Monthly optimal?
  - Target around dry off and calving?

# Somatic Cell Counts (2)

- Some challenges
  - Managing 'absent cows'
  - More limited use in very low SCC herds
    - Why bother...

THE GLOBAL STANDARD  
FOR LIVESTOCK DATA

The University of  
Nottingham

# Clinical Mastitis

- Cow ID
- Date
- Quarter(s)
  - LF, LH, RF, RH (+UnK!)
- Severity
  - 1 - Mild (milk signs only)
  - 2 - Moderate (milk and udder signs)
  - 3 - Severe (sick cow)
  - 4 - Toxic

THE GLOBAL STANDARD  
FOR LIVESTOCK DATA

The University of  
**Nottingham**

# Aetiology

- Methods
  - Lab based vs Farm based
    - Quality control
    - Sens and specs of many on farm kits not established
  - Bacteriology vs PCR
    - Pros and Cons for both
- Objective?
  - Contagious vs Environmental...
- Inc sensitivity testing?...

# Other Measures

- Conductivity
- CMT
- *etc*

Test	Estimated Sensitivity (%)	Estimated Specificity (%)	Time to result	Location
Milk or cow inspection	80	100	Seconds	Cow side
SCC (DHI testing)	75	75	Minutes	Lab
SCC (On farm testing)*	<=75	<=75	Minutes	On farm
CMT <sup>+</sup>	75	75	Seconds	Cow side
Conductivity (Hand held)	80	-	Seconds	Cow side
Conductivity (AMS)	-	-	Seconds	Cow side
Milk Temperature	50	70	Seconds	Cow side
Yield – manual assessment	20-40	Low	Seconds	Cow side
NAGase	70-100	95	Minutes	Lab
Milk colour using real time digital camera technology	-	-	Seconds	Cow side
Acute Phase Proteins eg Milk Amyloid A (MAA)	-	-	Minutes	Lab
Lactate dehydrogenase (LDH)	-	-	Minutes	Lab
Adenosine Triphosphate (ATP)	-	-	Minutes	Lab
“Electronic tongue” – using an array of chemical sensors and computer data algorithm processing.	-	-	Seconds	Cow side

- Maybe to record Sub-clinical mastitis and method of detection?

# Treatments

- Clinical and Sub-clinical Treatment
  - Primarily for antibiotic use
- Route
  - Intramammary vs Systemic
  - Antibiotic class(es)
- Dose and Duration
- Dry Cow Therapy – ADCT and Sealants

THE GLOBAL STANDARD  
FOR LIVESTOCK DATA

The University of  
Nottingham

# Teat End Callosity Scores (TEC)

- As an investigative tool?
- On a regular basis?
  - R and **VR**
    - Associated with increased risk of clinical disease
  - S
    - Associated with decrease risk of elevated SCC

**N (no ring)**  
No callosity ring present at the teat end.

**S (smooth ring)**  
Parakeratosis, characterised by a smooth or slightly rough callosity ring at the teat end.

**R (rough ring)**  
Hyperkeratosis of the teat epidermis and eversion of the teat end.

**VR (very rough ring)**  
Hyperkeratosis of the teat epidermis with keratin fronding of the teat orifice and severe teat end eversion.

# 'Newer' Technologies

- Differential cell counting
- Cow-side and 'on-farm' testing
- How and when do we integrate these technologies
  - Lack of validation
  - Lack of standardisation
  - Lack of calibration

THE GLOBAL STANDARD  
FOR LIVESTOCK DATA

The University of  
**Nottingham**

SCC and Clinical Mastitis Data  
Need Both!

# USE AND INTERPRETATION

THE GLOBAL STANDARD  
FOR LIVESTOCK DATA

The University of  
**Nottingham**

# SCC Data Interpretation

- Disease Monitoring
  - 200,000 cells/ml threshold
    - Higher threshold in early lactation?
  - ‘Virtual High’ for the absent cow
- Management
  - Segregation and cow selection
  - ADCT selection
- ‘Slate wiped clean’ at dry off (not calving)
- Lag phase

THE GLOBAL STANDARD  
FOR LIVESTOCK DATA

The University of  
**Nottingham**

# Simple Definitions

- In lactation
  - $<200K$  to  $>200K$  = new IMI
  - 2 of 3  $>200K$  = Chronic
- Across the dry period
  - Movements around the 200K threshold
    - Fresh Calver Infection Rate
    - Dry Period Cure Rate
    - Dry Period New Infection Rate

# Does SCC predict Clinical Mastitis?

n = 200 UK dairy herds

THE GLOBAL STANDARD  
FOR LIVESTOCK DATA

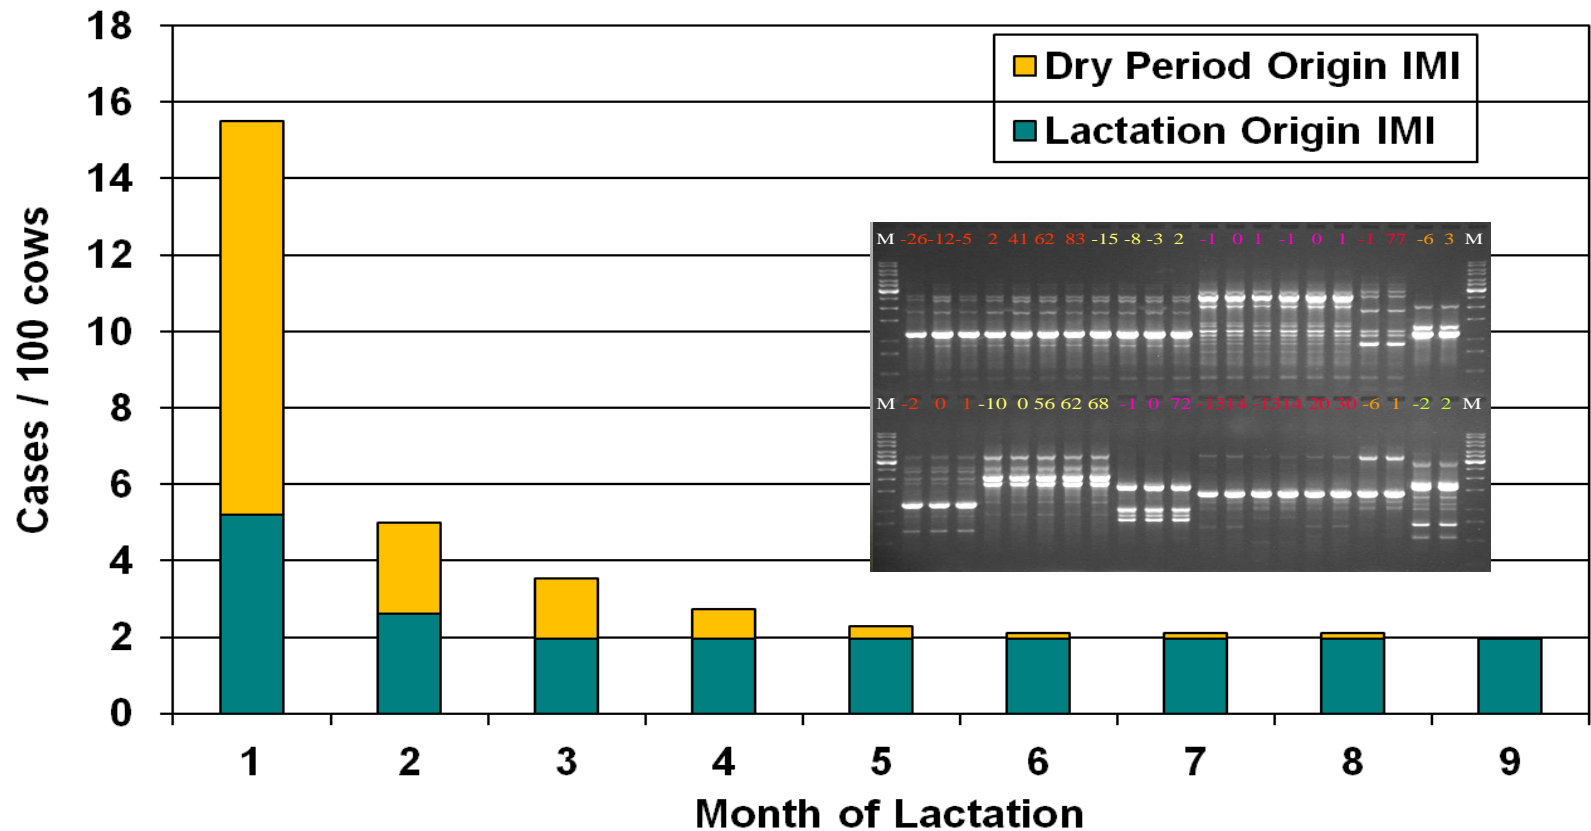

The University of  
Nottingham

# CM Data Interpretation

- Predict Origin of Infection
  - Dry vs lactating period
- Most analysis at the cow level
  - Some qrt level indices used
- 'Slate wiped clean' at dry off (not calving)
- Focussed on index (1<sup>st</sup>) cases
  - Lag phase (7 days)
- Also consider severity

# Origin of Clinical Mastitis

THE GLOBAL STANDARD  
FOR LIVESTOCK DATA

The University of  
Nottingham

# Patterns of Clinical Mastitis

- Temporal pattern of development of disease
- INDEX (first) cases during lactation
  - $\leq 1$  in 12 cows get clinical mastitis in first 30 days of lactation
  - $\leq 2$  in 12 cows get clinical mastitis in the rest of lactation
