

K-Projekt **ADDA** – ADvancement of Dairying in Austria
 „Strategies to a Reduced Antimicrobial Use in Cattle“

Bacteriological milk samples and udder health

ICAR, Udder health meeting, 13th of June, 2017, Edinburgh

**W. Obritzhauser¹, M. Suntinger³, B. Fürst-Waltl³, M. Mayerhofer²,
 C. Firth¹, C. Egger-Danner²**

¹*Institut für Öffentliches Veterinärwesen, Vetmeduni, Vienna*

²*ZuchtData EDV-Dienstleistungen GmbH, Vienna*

³*Institut für Nutztierwissenschaften, Universität für Bodenkultur, Wien*

- Improvement of udder health is important
 - herdmanagement
 - genetic improvement
 - food safety
- Various data sources of importance
 - somatic cell count, diagnoses, pathogen information,...
- Bacteriological milk samples (pathogens)
 - Targeted treatment
 - relevant in the context of reduction of use of antimicrobials
 - additional information for genetic and herd management

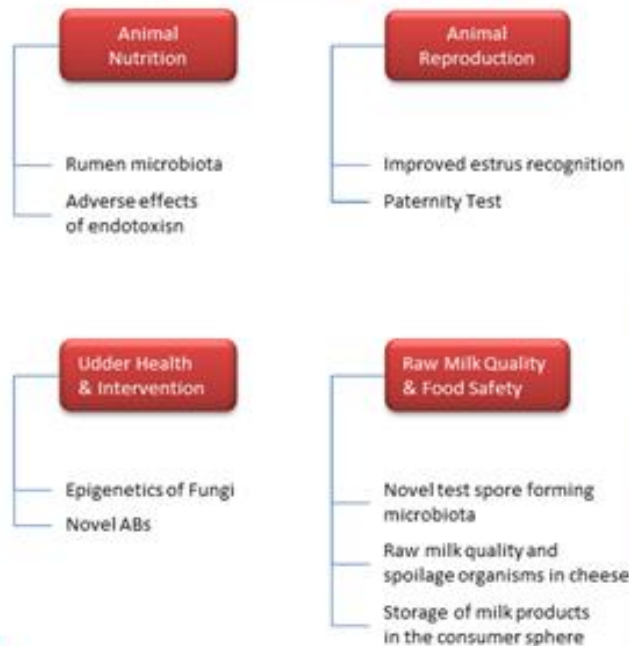

ADDA „Advancement of Dairying in Austria“ Project 2014-2017

Comet K-Projekt ADDA

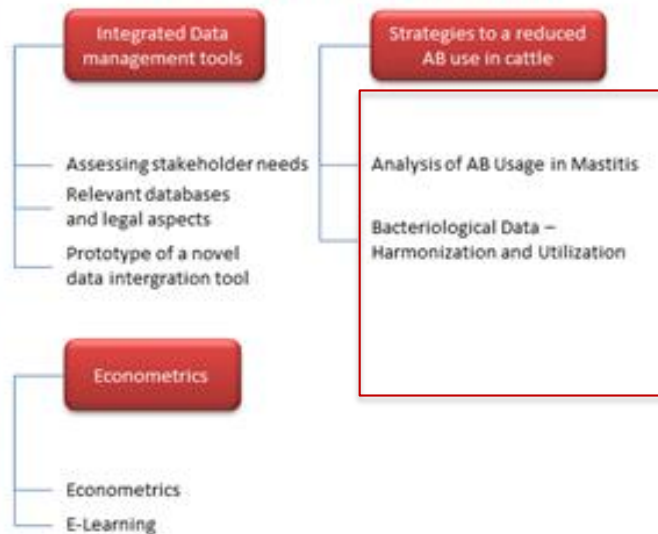

Advancement of Dairying in Austria

- Research along the dairy chain including partners from farmer organisations, animal health service, feed companies, milk processors, labs, chamber of veterinarians, universities etc.

AREA 1 - Fundamentals of milk production and safety

AREA 2- Constituents of competitive milk production

- ***Subproject 1 (A2_P1): Added value of linkage of various data sources on udder health***
 - somatic cell count, diagnoses, bact. milk samples, bulk milk results
- ***Subproject 1 (A2_P2-SP1): Harmonization in bacteriological data generation***
 - harmonisation of methods for bacteriological analyses of milk samples
 - harmonisation of definition of results – link to health key
 - electronic data transmission to central cattle data base–interface

What is important for stakeholders?

Comet K-Projekt ADDA

(Result of ADDA-survey on farmers and vets)

Advancement of Dairying in Austria

	% very important and important	
	Farmer	Veterinarian
Bacteriological milk samples	81	94
Milk samples for dairies	78	74

FAR
RINDERZUCHT
AUSTRIA

ZuchtData
EDV-DIENSTLEISTUNGEN GMBH

LKV

RDV GmbH
Rinder Daten Verbund

AIM: generation of added value by merging data and turning this data into information

From frequent overview to detailed information e.g. udder health

- Dairy: **bulk tank milk sample**
 - *at least weekly*
 - *herd based*
- Data from milk recording
 - every 4-6 weeks
 - animal based
- **Farmer observations** – real time
- Veterinarian diagnoses / **treatment**
 - real time information
- Results from laboratories
 - e.g. **bacteriological samples** (each quarter)
- Other information (AMS, MIR,..)

Observational study from 01-10-2015 till 30-09-2016

- Use of antimicrobials in dairy farms focus on mastitis
 - 250 farms with about 7000 cows
 - 17 veterinarians
- Treatment data from vets
 - Electronic interface directly to central database
- Sampling of each quarter before treatment
 - Bact. – interface („milk-bacteriological analyses“)

Preconditions – work to do:

- Standardisation for data integration -
 - *Starting point AUSTRIA*: 6 laboratories with differences regarding bacteriological analyses (methods), coding, ... - no comparable results
 - *Starting point AUSTRIA* : results primarily provided in a format that cannot be integrated in the central cattle database

Harmonised analyses of bacteriological milk samples

- Aim: Integration of results of bacteriological milk samples into central database
 - ✓ Standardised methods (guideline)
 - ✓ Defined Code-Set (ADIS-ADET)
 - ✓ Definition der BACT-interface
 - ✓ Access of labs to central database
 - ✓ Clarification of data protection issues
 - ≠ Check of resistance: unified panel to test antimicrobials (different labs use different panels – needs further work!)

Harmonisation of methods

- ✓ Standardised methods (Guideline)

*De Haas et al. 2002 / Haugaard et al. 2012

AUT: results based on data from labs before harmonisation – analyses with harmonised data in work

Bacteriological milk samples

Challenges

❖ **False positive results (false negative ?) possibility to filter?**

❖ **„Benchmarking – comparison of farms “**

❖ Criteria for validation

Problem: heterogeneity in taking samples

Sampling → Single animals analysed vs. whole farms

Regular controls vs. sometimes (e.g. at dry off...)

❖ Grouping of pathogens ? Terminology?

❖ contagious vs. environmental

❖ major pathogens vs. minor pathogens vs. others

**→ effective grouping of pathogens? relevant grouping....?
necessary for herd management and recommendations**

- Results of bacteriological milk sampling valuable information for targeted treatment and herd management
- Potential for genetic analyses
- **Difficulties/Challenges:**
 - Different strategies on farm for sampling (routinely before mastitis, before dry off, partly herd sampling, partly individual cows,..)
 - Harmonized and comparable results
 - Harmonized terminology
 - Unified grouping of codings – for recommendations
 - Comparable panels for testing of antimicrobials resistance are a further challenge

- Results of the bacteriological milk samples should be harmonized and recorded centrally
- Valuable for herd management and targeted use of antimicrobials
- Potential use for genetics as additional and more detailed information
- What can be included in ICAR Udder Health Guidelines?
 - Has IDF done work on that ? Terminology?
 - ICAR – set for codes and inclusion in ICAR Health Key?
 - Grouping of pathogens (contagious vs. environment associated; major vs minor pathogens vs other ?)
 - What should be included in guidelines?
- What is valuable for ICAR guidelines?
- How to continue?

Use of bacteriological milk samples for herd management and genetics

Thank you

Acknowledgement:
