

Impact simulation of feed levers on ruminant farms sustainability with CAP'2ER®

Etienne GOUMAND

French Livestock Institute – Paris

29th April 2021

Introduction

- Our objectives for the dairy/beef sectors in France :
 - Reducing the milk and meat carbon footprint (20% for the milk and 15% for the meat from 2015 to 2025)
 - Improve dairy and meat sustainability
 - Implementing knowledge on environmental burdens and dairy/beef farming
 - Training advisers and farmers
 - Disseminating low carbon practices
 - Developing a national strategy and a multi stakeholders partnership

A sustainability analysis in livestock

				
Animal categories				
Environmental burdens	 Greenhouse gases emissions kg CH ₄ , kg N ₂ O, kg CO ₂ → kg CO ₂ eq	 Air quality (acidification) kg NH ₃ emitted → kg SO ₂ eq	 Water quality (eutrophication) kg N and kg P leaching → kg PO ₄ eq	 Energy consumption Direct and indirect energy → MJ
Positives contributions	 Carbon sequestration kg carbon /year	 Conservation of biodiversity ha eq of biodiversity	 Food performance Number of fed people/year <small>Perfalim*</small>	
Durability indicators	 Economic performances Production costs		 Work conditions Quantity of work, painfulness...	

CAP'2ER is following IPCC methodology

	Sources	Methodology
Methane	Enteric fermentation	IPCC 2006 – Tiers 3 Sauvant et al, 2014
	Manure	IPCC 2006 – Tiers 2
Nitrous oxide	Manure management, mineral fertilizers	IPCC 2006 – Tiers 1 and 2
Carbon dioxide	Energy consumption	French data base
	Inputs	Ecolinvent, Ecoalim, 2016

▶ **CAP'2ER in accordance with**

- ▶ LEAP (FAO) guidelines
- ▶ IDF guidelines

▶ **CAP'2ER certified by**

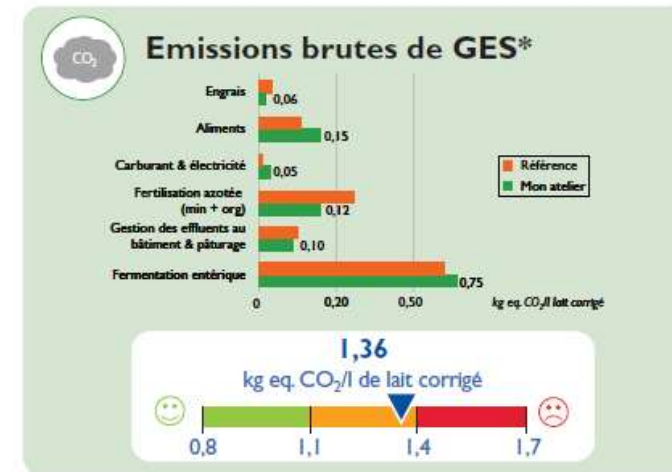

Two levels of assessment in CAP'2ER

▶ CAP'2ER Level 1

- ▶ A simplified analysis at dairy unit level
- ▶ 29 activity data / 1 hour to collect data and to present results to farmers
- ▶ To develop an observatory
- ▶ To highlight the link between practices and environment

▶ CAP'2ER Level 2

- ▶ A Complete analysis at farm level
- ▶ 150 activity data / half day to collect data and to present results to farmers
- ▶ To simulate mitigation practices
- ▶ To build individual carbon action plans

Activity data collected

Herd
(animal categories and number, yield,..)

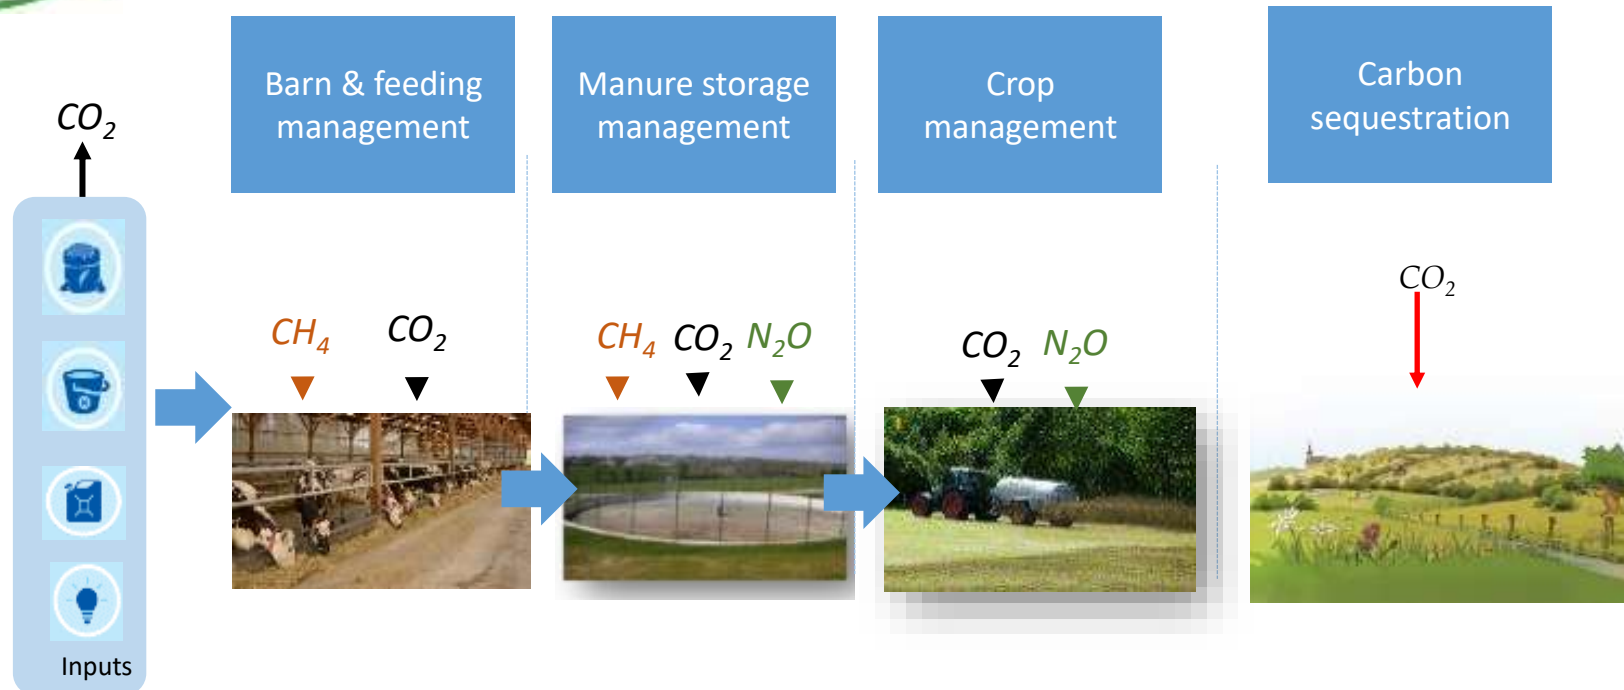

Manure management
(shed, storage,..)

Areas
(practices, rotation, fertilizers,..)

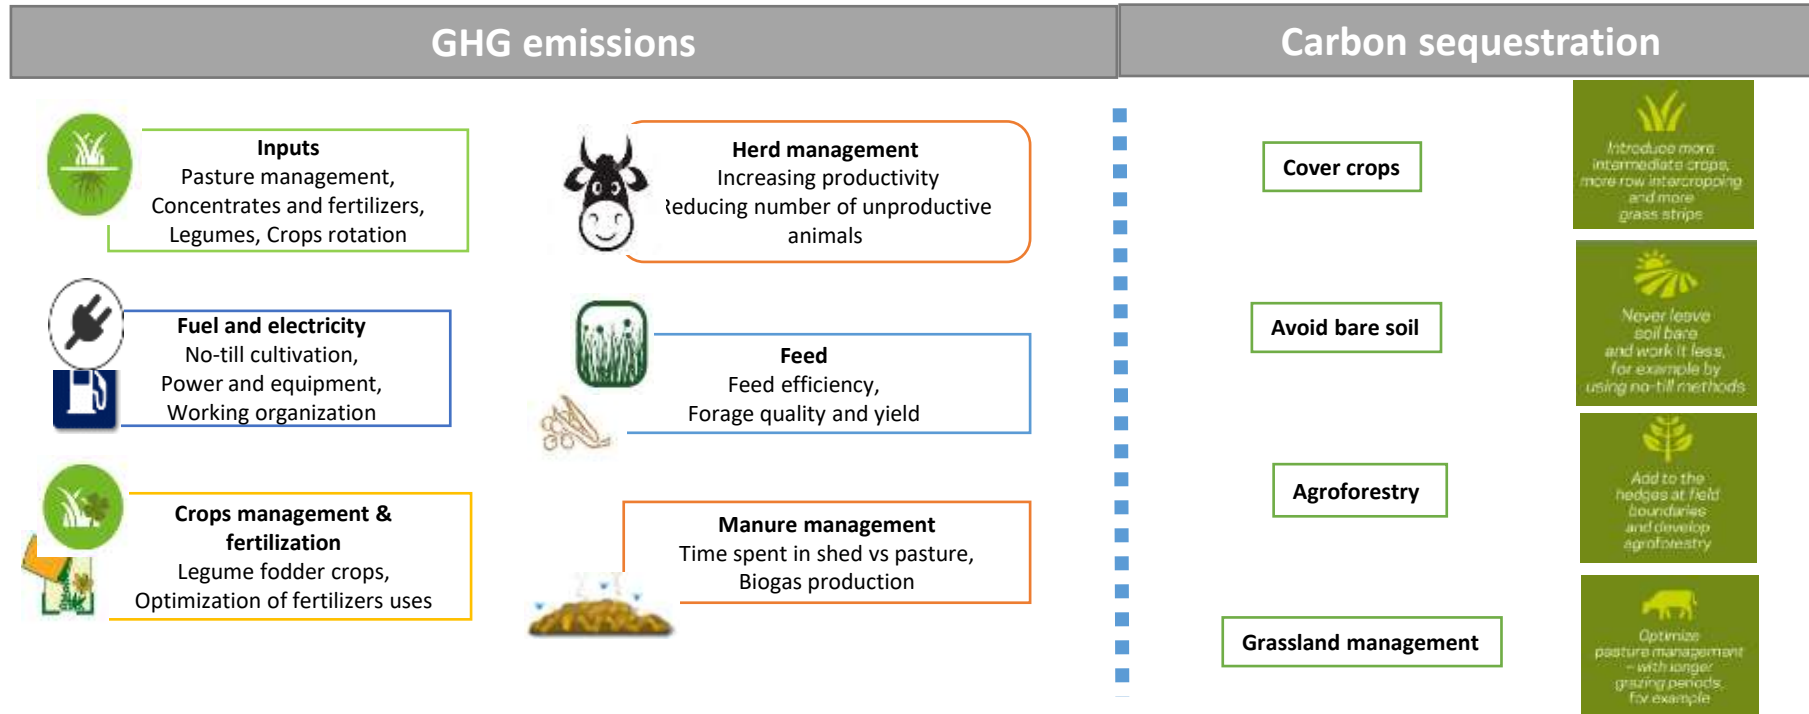

Feed (forage, concentrate, quality/quantity)

Energy consumption

A LCA whole farm assessment

More than 40 mitigations practices

Focus on feed levers

- Several actions may be implemented to reduce GHG emissions :
 - Reducing feed wastage in fodder and concentrates
 - Ration balance: reduce overconsumption of concentrates,
 - Increasing milk yield in accordance with genetic potential
 - Reducing the use of imported soybean meal
 - Improving protein autonomy through fodder: fodder quality, protein crop mix
 - Making better use of grass: increasing the proportion of grass in the ration by grazing and harvesting, increasing grass yield

GHG emissions reduction potential : from 2% to 8%

Substitution of soybean by rapeseed

Typical dairy farm in Western France
Optimised ration of 28 litre milk / day

1.42 kg DM of soybean meal

EF : 1.579 kg CO₂ / kg (including deforestation)

At ration level : 0.29 kg CO₂ / kg DM
At farm level : 0.87 kg CO₂ / litre of milk

2.13 kg DM of rapeseed meal

EF : 0.46 kg CO₂ / kg

At ration level : 0.22 kg CO₂ / kg DM
At farm level : 0.81 kg CO₂ / litre of milk

Conclusion

- CAP'2ER: multi-criteria modelling tool for environmental assessment and technical support in ruminant farm
- Simulation of action levers impact on GHG emissions, in particular levers on cattle feeding
- Feed levers : potential of GHG reduction from 2% to 8%
- Substitution of soybean meal by rapeseed very efficient because it reduces deforestation

Thanks for your attention
