

# How can cow-individual sensor data, national data, and drone images improve our understanding of resilience

ICAR April 2021

Claudia Kamphuis, Wijbrand Ouweltjes, Marieke Poppe, Sander Mucher, and Yvette de Haas  
*Wageningen University and Research*

# What to expect today

- 1 Background information
- 2 Developing cow specific resilience proxies
- 3 Predicting lifetime resilience using sensor data and machine learning
- 4 Camera-mounted drones to obtain cow characteristics for resilience
- 5 Take-home messages

# 1 Background information

What is a resilient dairy cow?

Advantages of improving resilience are clear but how?  
long-term, multifactorial, complex trait  
management affects disturbances and resistance  
lack of phenotypic info

# 1. Background information

Sensors offer high-frequent, longitudinal, and continuous time-series of data at cow individual level

Can we develop proxies using sensor data?

Can we predict resilience?

Can machine learning be of help?

Can drones aid in extracting information for resilience?

# 2 Developing cow specific resilience proxies

Using daily milk yield records

Sensitive to different kinds of disturbances & available on daily basis (AMS)

# 2 Developing cow specific resilience proxies

Collected daily milk yield data

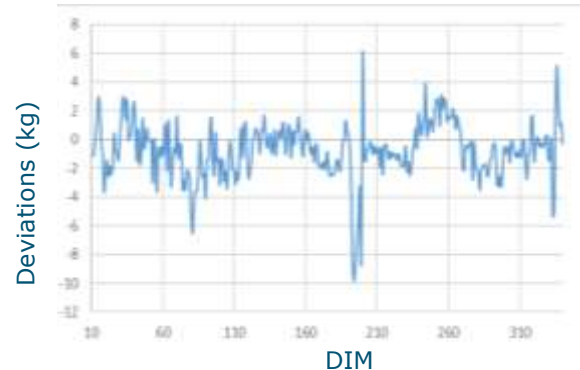

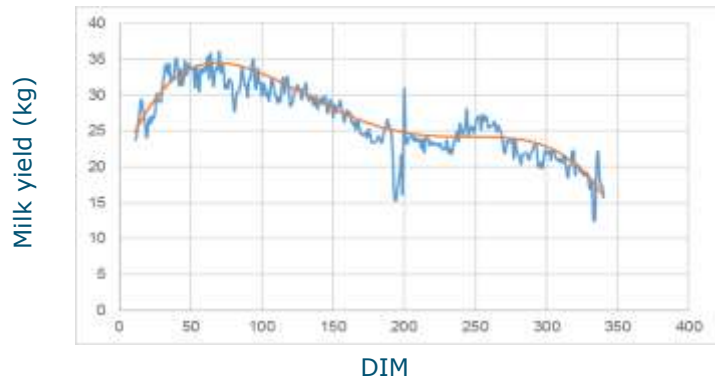

~200K primiparous Holstein cows (CRV)  
up to 350DIM

4<sup>th</sup> order polynomial 0.7 quantile regression curve

reflecting potential yield without disturbances

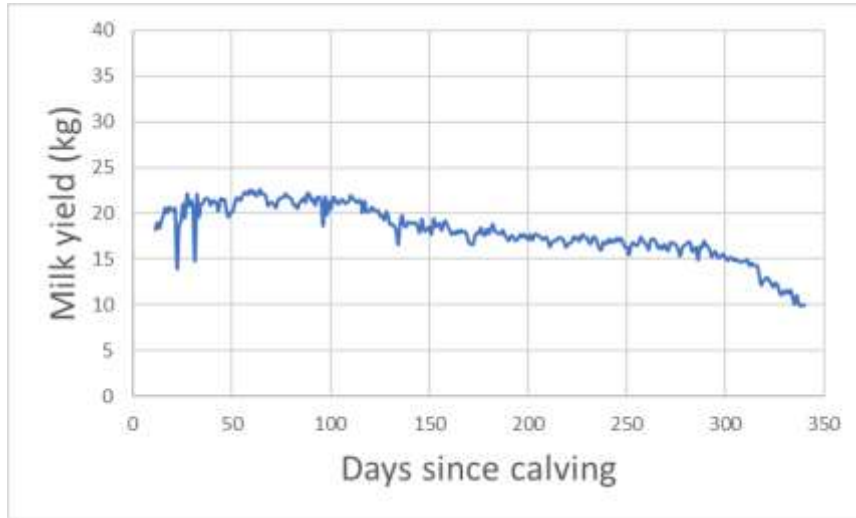

Calculated deviations from disturbance-free regression curve

Calculated natural transformed logarithm of variance as proxy

**LnVar**

## 2 Developing cow specific resilience proxies

Low variance  
***Resilient?***

High variance  
***Not resilient?***

# 2 Developing cow specific resilience proxies

LnVar demonstrated to have

a good heritability (0.21) & genetic correlation with mean milk yield (0.79)  
good genetic correlation with other traits in the expected direction

|             | <b>Udder health</b> | <b>Hoof Health</b> | <b>Ketosis resistance</b> | <b>Longevity</b> | <b>Fertility</b> | <b>BCS</b> |
|-------------|---------------------|--------------------|---------------------------|------------------|------------------|------------|
| Correlation | -0.32               | -0.04              | -0.33                     | -0.34            | -0.17            | -0.40      |

LnVAR seems to be a useful cow-individual proxy for resilience

## 2 Developing cow specific resilience proxies

What about resilience at herd level?

Herd management is expected to influence both cow resilience and number and severity of disturbances

are there differences in herd resilience between herds?

can these differences be explained by herd performance indicators and management?

Variance = **Herd-Year** + Animal + Year-Season + e

~227K primiparous Holstein cows

2,644 herds for years 2011-2017: 9,917 herd-year classes

Indicators of performance and management from national milk recording system

## 2 Developing cow specific resilience proxies

$$\text{Variance} = \text{Herd-Year} + \text{Animal} + \text{Year-Season} + e$$

## 2 Developing cow specific resilience proxies

| Herd performance indicator              | Correlation with variance |
|---|---------------------------|
| Somatic cell score                      | 0.19                      |
| % cows with acidosis indication         | 0.31                      |
| % cows with ketosis indication          | 0.03                      |
| % survival to 2 <sup>nd</sup> lactation | -0.13                     |
| Calving interval                        | 0.14                      |
| Milk yield                              | 0.10                      |

Poor resilience = low health and fertility

Rumen acidosis indication important →  
feed management important?

Milk yield hardly affects variance

# 3 Predicting lifetime resilience using sensor data and machine learning

There is more than just milk yield information available on-farm

Multiple lactations, good (re)productive performance, no/few health problems that are overcome easily, efficient and consistent in milk production  
(Adriaens et al., 2020)

# 3 Predicting lifetime resilience using sensor data and machine learning

## Lifetime Resilience Scoring system

(Adriaens et al., 2020)

- A summation of scores for
- number of lactations
  - age at first calving/calving interval
  - number of inseminations
  - number of curative treatment days
  - When culled in lactation

1,800 cows scored  
Average 1,518 (31 – 6,031)

Divided into 3 evenly distributed classes (H,M,L)

Cows with data from 4 sensor in first parity  
N = 370 (109H, 141M, 120L)

# 3 Predicting lifetime resilience using sensor data and machine learning

## Activity, Rumination, Weight and Milk yield to predict LRS

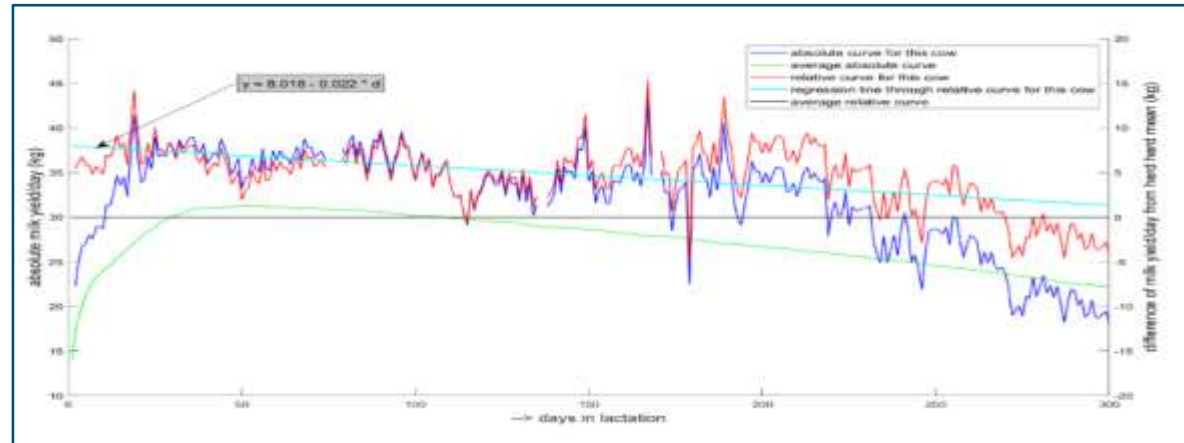

sensor data aggregated to daily values

for each cow, for each sensor, 14 sensor features

mean, minimum, maximum, 25<sup>th</sup> 50<sup>th</sup> and 75<sup>th</sup> percentile, std, skewness, kurtosis, autocorrelation (lag1)  
slope, intercept, residual standard deviation

correlation relative curve values - fitted curve values

# 3 Predicting lifetime resilience using sensor data and machine learning

Activity, Rumination, Weight and Milk yield to predict LRS

sensor data aggregated to daily values

for each lactation, for each sensor, 14 sensor features per sensor (56 total)

absolute daily values and their lactation averages (1,204 features)

## **Ordinal logistic regression**

56 features

Stepwise selection ( $p \leq 0.2$ )

6 features selected

## **3 Random forests**

6 significant sensor features

56 sensor features

1,204 daily values as features

all models: 10-fold cross validation

# 3 Predicting lifetime resilience using sensor data and machine learning

Performance      Accuracy (ACC)  
Critical misclassified (CritMis)

# 5 Take-home messages

The natural logarithm of the variance of deviations in daily milk yield is a good sensor-based proxy for resilience for individual cows

There were differences in herd resilience; feed management may have an important role

Random Forests require less pre-processing of sensor data to achieve similar classification performance as logistic regression

Camera-mounted drones are promising technologies for collecting resilience indicators in outdoor systems
