

**Maximize your
quality of life
with sustainable
forage systems**

My Forage System

Why We Chose ADE ?

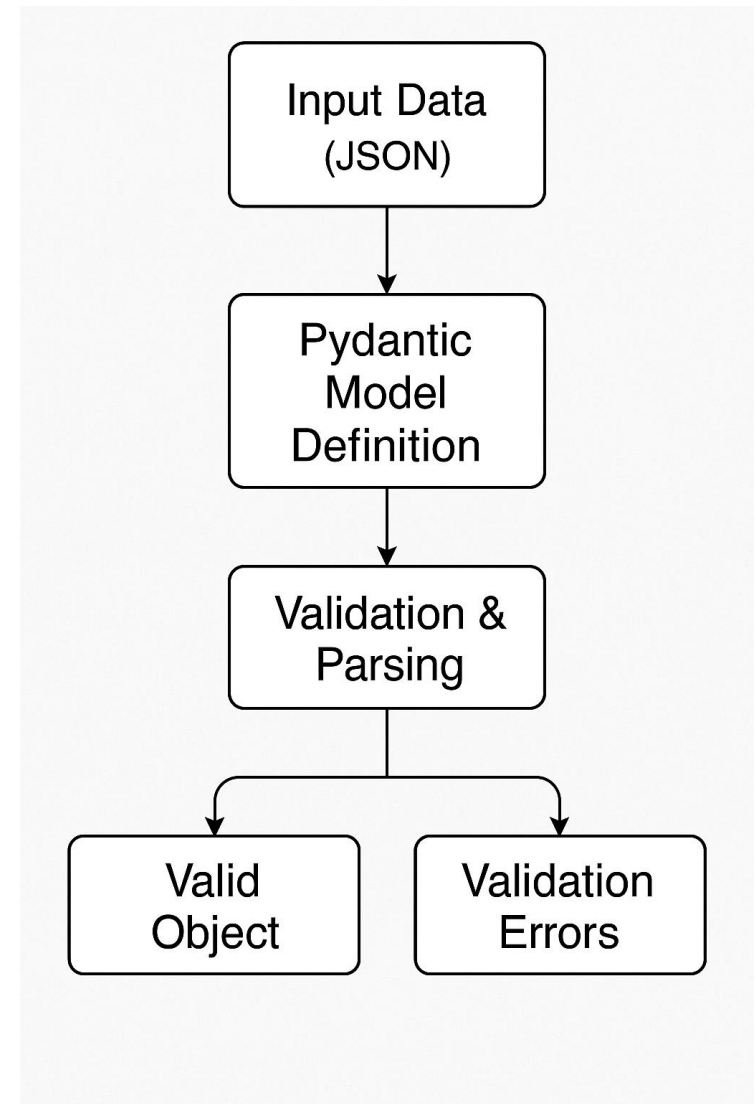

- To avoid starting from scratch.
- We saw ICAR ADE as a way to:
 - Reduce trial and error in system design.
 - Adopt best practices faster.
 - Improve interoperability with future partners.
- ICAR ADE agrees with our vision by linking biological, management, and outcome data.

Our Implementation Strategy

1. Convert ADE specifications into Pydantic models.
2. Use Pydantic models in Django for validation and reference for defining database schema.
3. Integrate models progressively into platform: herd, pasture, feeding.

What is Pydantic ?

- **Pydantic** is a Python library used for:
 - Defining data models (similar to data classes with strict typing).
 - Validating and parsing input data (from JSON, dict, etc.).
 - Producing clear error messages.

Automation Pipeline Overview

Trigger the
Pipeline

Current Gaps in ADE

- **We encountered key limitations when working on:**
 - **Beef cattle, sheep, and goat data:** Not fully supported
 - **Pasture feeding:** Limited modeling for grazing systems
 - **Wool yield tracking:** Not present
 - **Non-traditional sample types:** Blood, feces, etc., with seropositivity data—needed for diseases like paratuberculosis.
 - **Lack of proposed database architecture aligned with ADE**

How to Strengthen the Ecosystem

- **Based on our experience, here's what could improve adoption and collaboration:**
 - **Lower entry barrier:** Current fees and structure limit startup access.
 - **Increase engagement:** Add more dynamic and inclusive formats.
 - **Enable semantic mapping:** Use shared ontology (e.g., Wikibase) for better interoperability.
 - **Improve async work:** Use Slack channels to follow key discussions across time zones.

Looking Ahead & Let's Connect

- We're excited to continue collaborating and contributing to the ADE ecosystem.
- If anyone here is interested in Pydantic models or developing basic database schemas based on ADE, let's talk!
