## **Form BEEF**

# **DATA COLLECTION**

Trait name  Carcass fat (CFA)  Limousin (taken from across breed evaluation including on phenotypes from 73 other breeds)  The carcass is graded under the EUROP scale with the five main classes (1, 2, 3, 4, 5) but abattoirs differed by the use of both the 7 point and 15 point scale. The 15 point scale was used and converted to a numerical value 1 to 15 and the 7 point and 15 point scale were applied to this as shown in Table 19. A 15 point scale were applied to this as shown in Table 19. A 15 point scales were applied to this as shown in Table 19. A 15 point scale with values 1 to 15 as used by Hickey et al (2007¹) would result the same as the values 3 to 45.  Method and frequency of measurement  Who does the performance recording?  Method of collecting data  Carcass is scored according to the EUROP grading system  Abattoir  Carcass is scored according to the EUROP grading system  Any passing through abattoir  Yes  Is the data adjusted and/or selected? Yes  Is the data adjusted and/or selected? All breeds are adjusted to a common variance by scaling the records on an individual for each trait using the following formula where i is the appropriate breed and sex and j is the appropriate sex but breed type=2.  Scaled phenotype = Average(i) + [(phenotype − average(i)) *(std(j)/std(i))]  Breed types are defined as 1= Dairy, 2=Native beef, 3=Continental beef, 4=Other  Time period for inclusion of data  Criteria (data edits) for inclusion of records  Remove duplicates  Must be prime slaughter animal Sex must be recorded  12months <slaughterage<36 carcass="" months="" weight="">50kg</slaughterage<36>	Country (or countries)	UK				
Trait definition  The carcass is graded under the EUROP scale with the five main classes (1, 2, 3, 4, 5) but abattoirs differed by the use of both the 7 point and 15 point scale. The 15 point scale was used and converted to a numerical value 1 to 15 and the 7 point and 15 point scales were applied to this as shown in Table 19. A 15 point scales were applied to this as shown in Table 19. A 15 point scale with values 1 to 15 as used by Hickey et al (2007¹) would result the same as the values 3 to 45.  Method and frequency of measurement per animal  Who does the performance recording?  Method of collecting data  Which animals get recorded?  Is birthday recorded?  Is the data adjusted and/or selecte?  If yes please describe the methodology applied  All breeds are adjusted to a common variance by scaling the records on an individual for each trait using the following formula where i is the appropriate breed and sex and j is the appropriate sex but breed type=2.  Scaled phenotype = Average(i) + [(phenotype – average(i)) *(std(j)/std(j))]  Breed types are defined as 1= Dairy, 2=Native beef, 3=Continental beef, 4=Other  Time period for inclusion of data  Criteria (data edits) for inclusion of records  Remove duplicates  Must be prime slaughter animal  Sex must be recorded  12months Slaughterage<36 months  Carcass weight>50kg	Trait name					
Trait definition  The carcass is graded under the EUROP scale with the five main classes (1, 2, 3, 4, 5) but abattoirs differed by the use of both the 7 point and 15 point scale. 	killdate supplied by the abattoir must be within 10 days of BCMS					
Is embryo transfer applied? How are ET animals identified? Is recipient mother ID recorded?	ET animals removed  Whole record removed if any of the above criteria are not met					
How do you treat incomplete data?						
MODEL						
Model used for genetic evaluation	MT-AM-FR					
Environmental effects	BirthHYS, 170231 (F) Slage (X) Slage2 (X) Killsite, 11 (F) Sex,3 (F) Finishingherd, 23195 (F) Killseason, 52 (F) Killseasonsex, 156 (F) Dam age (X) Percentagedairy (X) Het 1 (X) Het 2 (X) Het 3 (X) Het 4 (X) Het 5 (X) Het 6 (X) Rec 1 (X) Rec 2 (X) Rec 3 (X) Rec 4 (X) Rec 5 (X) Slagepercentdairy (X) Slagedamage (X) Damagepercentdairy (X)					
Use of genetic groups and relationships	Slage2sex (X)  A relationship matrix is formed based on available pedigree and genotype information. Genetic groups are based on the animal's breed type. Breed types are defined as Dairy, Continental beef, Native beef, Other					
Genetic parameters in the model	See appendix I					
Adjustment for heterogeneous variance in evaluation model	Heterosis and Recombination coefficients were calculate from the breed type proportions of the animal's sire and dam and the formulae are as follows:  [heterosis] _ij=(( [sire] _i* [dam] _j)+( [sire] _i*					

<sup>1</sup> Hickey, J.M., Keane, M.G., Kenny, D.A., Cromie, A.R., and Veerkamp, R.F. 2007. Genetic parameters for EUROP carcass traits within different groups of cattle in Ireland. Journal of Animal Science 85:314-321.

	[dam] _i ))/100 [recombination] _ij=(( [sire] _i* [sire] _j )+( [dam] _i* [dam] _j))/100				
	Breed types are defined as 1= Dairy, 2=Native beef, 3=Continental beef, 4=Other				
	Het 1 and Rec 1 = breed types 1 and 2 Het 2 and Rec 2 = breed types 1 and 3 Het 3 and Rec 3 = breed types 1 and 4 Het 4 and Rec 4 = breed types 2 and 3 Het 5 and Rec 5 = breed types 2 and 4 Het 6 and Rec 6 = breed types 3 and 4 These 12 terms are then fitted as covariates in the model				
System validation	Pre evaluation data quality checks and formation of contemporary groups. Genetic evaluation undertaken using MiX99. Post evaluation checks include adjusting for the genetic base, quality assurance checks and data summaries.				
Definition of genetic reference base Next base change	Genetic reference animals are those animals that are born in 2010.				
Assessment of index quality (computation of reliability, connection)	Reliabilities are computed using the mix99 software using the Mistztal and Wiggans (1988) calculation method.				
PUBLICATION  Expression of genetic evaluations	EBVs and GEBVs are published for registered animals on https://www.taurusdata.co.uk/beef on behalf of British Limousin Cattle Society				
Criteria for official publication of evaluations	EBVs are published where accuracy>0.5 If genotyped on or before 01/03/2018 members have the option to publish their GEBVs If genotyped after 01/03/2018 all GEBVs are published				
Number of evaluations / publications per year	3 times a year				
Anticipated changes in the near future	None				
Key reference on methodology applied	The mix99 software package is used for the genetic evaluations (Lidauer and Stranden, 1999; Vuori et al., 2006)				
Key organization: contact person, address, phone, fax, e-mail, web site	Scotland's Rural College (SRUC) contact persons: Abbygail Wells and Samir Id-Lahoucine Roslin Institute Building Bush Estate Penicuik, EH25 9RG abbygail.wells@sruc.ac.uk samir.idlahoucine@sruc.ac.uk https://www.sruc.ac.uk				

<sup>1</sup> Hickey, J.M., Keane, M.G., Kenny, D.A., Cromie, A.R., and Veerkamp, R.F. 2007. Genetic parameters for EUROP carcass traits within different groups of cattle in Ireland. Journal of Animal Science 85:314-321.

#### **Form BEEF**

**Appendix I BEEF** 

Parameters used in genetic evaluation

**Country: United Kindgom** 

Main trait group: Carcass fat (CFA

#### **Breed:Limousin**

Trait <sup>(1)</sup>	Definition	h <sub>d</sub> <sup>2</sup>	h <sub>m</sub> <sup>2</sup>	r <sub>g(d,m)</sub>	c <sup>2</sup>	$\sigma_{p}^{2}$
CFA	Carcass fat	0.32	-	-	-	19.94

 $h_d^2$ : direct heritability;  $h_m^2$ : maternal heritability;  $r_{g(d,m)}$ : genetic correlation between direct and maternal effects;  $c^2$ : repeatability of (maternal) permanent environmental effects;  $\sigma_P^2$ : phenotypic variance. 1) If you have more than one trait provides the correlations between traits.
